

CMOS Programmable Timer High Voltage Types (20V Rating)

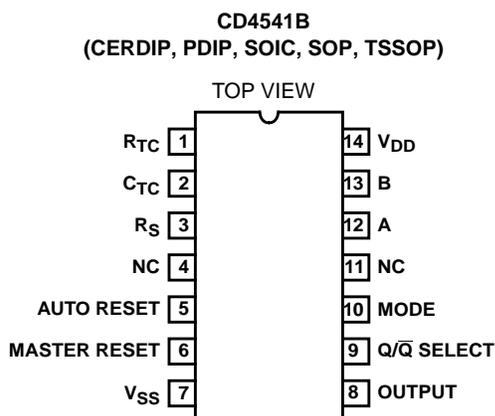

Features

- Low Symmetrical Output Resistance, Typically 100Ω at V_{DD} = 15V
- Built-In Low-Power RC Oscillator
- Oscillator Frequency Range DC to 100kHz
- External Clock (Applied to Pin 3) can be Used Instead of Oscillator
- Operates as 2^N Frequency Divider or as a Single-Transition Timer
- Q/ \bar{Q} Select Provides Output Logic Level Flexibility
- AUTO or MASTER RESET Disables Oscillator During Reset to Reduce Power Dissipation
- Operates With Very Slow Clock Rise and Fall Times
- Capable of Driving Six Low Power TTL Loads, Three Low-Power Schottky Loads, or Six HTL Loads Over the Rated Temperature Range
- Symmetrical Output Characteristics
- 100% Tested for Quiescent Current at 20V
- 5V, 10V, and 15V Parametric Ratings
- Meets All Requirements of JEDEC Standard No. 13B, "Standard Specifications for Description of 'B' Series CMOS Devices"

Description

CD4541B programmable timer consists of a 16-stage binary counter, an oscillator that is controlled by external R-C components (2 resistors and a capacitor), an automatic power-on reset circuit, and output control logic. The counter increments on positive-edge clock transitions and can also be reset via the MASTER RESET input.

Pinout

The output from this timer is the Q or \bar{Q} output from the 8th, 10th, 13th, or 16th counter stage. The desired stage is chosen using time-select inputs A and B (see Frequency Select Table).

The output is available in either of two modes selectable via the MODE input, pin 10 (see Truth Table). When this MODE input is a logic "1", the output will be a continuous square wave having a frequency equal to the oscillator frequency divided by 2^N. With the MODE input set to logic "0" and after a MASTER RESET is initiated, the output (assuming Q output has been selected) changes from a low to a high state after 2^{N-1} counts and remains in that state until another MASTER RESET pulse is applied or the MODE input is set to a logic "1".

Timing is initialized by setting the AUTO RESET input (pin 5) to logic "0" and turning power on. If pin 5 is set to logic "1", the AUTO RESET circuit is disabled and counting will not start until after a positive MASTER RESET pulse is applied and returns to a low level. The AUTO RESET consumes an appreciable amount of power and should not be used if low-power operation is desired. For reliable automatic power-on reset, V_{DD} should be greater than 5V.

The RC oscillator, shown in Figure 2, oscillates with a frequency determined by the RC network and is calculated using:

$$f = \frac{1}{2.3 R_{TC} C_{TC}}$$

Where f is between 1kHz and 100kHz and R_S ≥ 10kΩ and ≈ 2R_{TC}

Ordering Information

PART NUMBER	TEMP. RANGE (°C)	PACKAGE
CD4541BF3A	-55 to 125	14 Ld CERDIP
CD4541BE	-55 to 125	14 Ld PDIP
CD4541BM	-55 to 125	14 Ld SOIC
CD4541BMT	-55 to 125	14 Ld SOIC
CD4541BM96	-55 to 125	14 Ld SOIC
CD4541BNSR	-55 to 125	14 Ld SOP
CD4541BPW	-55 to 125	14 Ld TSSOP
CD4541BPWR	-55 to 125	14 Ld TSSOP

NOTE: When ordering, use the entire part number. The suffixes 96 and R denote tape and reel. The suffix T denotes a small-quantity reel of 250.

Absolute Maximum Ratings

DC Supply - Voltage Range, V_{DD}
 Voltages Referenced to V_{SS} Terminal -0.5V to +20V
 Input Voltage Range, All Inputs -0.5V to V_{DD} +0.5V
 DC Input Current, Any One Input ± 10 mA
 Device Dissipation Per Output Transistor
 For T_A = Full Package Temperature Range
 (All Package Types) 100mW

Operating Conditions

Temperature Range T_A -55°C to 125°C
 Supply Voltage Range
 For T_A = Full Package Temperature Range 3V (Min), 18V (Typ)

Thermal Information

Package Thermal Impedance, θ_{JA} (see Note 1)
 PDIP package 80°C/W
 SOIC package 86°C/W
 SOP package 76°C/W
 TSSOP package 113°C/W
 Maximum Junction Temperature (Plastic Package) 150°C
 Maximum Storage Temperature Range (T_{STG}) -65°C to 150°C
 Maximum Lead Temperature (Soldering 10s)
 At Distance 1/16in \pm 1/32in (1.59mm \pm 0.79mm)
 from case for 10s Maximum 265°C
 (SOIC - Lead Tips Only)

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTE:

- The package thermal impedance is calculated in accordance with JESD 51-7.

Digital Timer Application

A positive pulse on MASTER RESET resets the counters and latch. The output goes high and remains high until the number of pulses, selected by A and B, are counted. This circuit is retriggerable and is as accurate as the input frequency. If additional accuracy is desired, an external clock can be used on pin 3. A setup time equal to the width of the one-shot output is required immediately following initial power up, during which time the output will be high.
