#### (1) Cursor pointer set

The position of cursor is specified by X ADRS, Y ADRS. The cursor position is moved only by this command. The cursor pointer doesn't have the function of increment and decrement. The shift of cursor are set by this command. X ADRS, Y ADRS are specified following.

X ADRS                      00H~4FH (Lower 7bits are valid)

Y ADRS                      00H~1FH (Lower 5 bits are valid)

#### (2) Offset register set

The offset register is used to determine external character generator RAM area.

T693C has 16 bit address lines as follow.

MSB														LSB	
ad15	ad14	ad13	ad12	ad11	ad10	ad9	ad8	ad7	ad6	ad5	ad4	ad3	ad2	ad1	ad0

The upper 5 bit (ad15~ad11) are determined by offset register. The middle 8 bit (ad10~ad3) are determined by character code. The lower 3 bit (ad2~ad0) are determined by vertical counter. The lower 5 bit of D1 (data) are valid.

The data format of external character generator RAM.

### 3.Mode set

Code	Function	Operand
1000x000	“OR” Mode	-
1000x001	“EXOR” Mode	-
1000x011	“AND” Mode	-
1000x100	“TEXT ATTRIBUTE” Mode	-
10000xxx	Internal Character Generator Mode	-
10001xxx	External Character Generator Mode	-

The display mode is defined by this command. The display mode don't have changed until to send next this command. Logically “OR”, “EXOR”, “AND” of text and graphic display can be displayed.

When internal character generator mode is selected, character code 00H~7FH are selected from built-in character generator ROM. The character code 80H~FFH are automatically selected external character generator RAM.

(Example)

Graphic

Text

“OR”

“AND”

“EXOR”

Note: Only text display is attributed, because attribute data is located in graphic RAM area.

**POWERTIP TECHNOLOGY CORPORATION**

DISPLAY DEVICES FOR BETTER ELECTRONIC DESIGN

Attribute function

“Reverse display”, “Character blink” and “Inhibit” are called “Attribute”. The attribute data is written in the graphic area defined by Control word set command.

The mode set command selects text display only and graphic display cannot be displayed.

The attribute data of the 1st character in text area is written at the 1st 1byte in graphic area, and attribute data of n-th character is written at the n-th 1byte in graphic area. Attribute function is defined as follow.

Attribute RAM 1byte 

X	X	X	X	d3	d2	d1	d0
---	---	---	---	----	----	----	----

d3	d2	d1	d0	Function
0	0	0	0	Normal display
0	1	0	1	Reverse display
0	0	1	1	Inhibit display
1	0	0	0	Blink of normal display
1	1	0	1	Blink of reverse display
1	0	1	1	Blink of inhibit display

X : Don't care

**4.Display mode**

Code	Function	Operand
10010000	Display off	-
1001xx10	Cursor on , blink off	-
1001xx11	Cursor on , blink on	-
100101xx	Text on, graphic off	-
100110xx	Text off, graphic on	-
100111xx	Text on , graphic on	-

Note: It is necessary to turn on “Text display” and “ Graphic display “ in following case.

- (1) Combination of text/graphic display
- (2) Attribute function

### 5.Cursor pattern select

Code	Function	Operand
10100000	1 line cursor	-
10100001	2 lines cursor	-
10100010	3 lines cursor	-
10100011	4 lines cursor	-
10100100	5 lines cursor	-
10100101	6 lines cursor	-
10100110	7 lines cursor	-
10100111	8 lines cursor	-

When cursor display is ON, this command selects the cursor pattern from 1 line to 8 lines. The cursor address is defined by cursor pointer set command.

1 line cursor

2 lines cursor

8 lines cursor

### 6.Data auto read/write

Code	Hex.	Function	Operand
10110000	B0H	Data auto write set	-
10110001	B1H	Data auto read set	-
10110010	B2H	Auto reset	-

This command is convenient to send full screen data from external display RAM.

After setting auto mode, “Data write (or read)” command is not necessary between each data.

“Data write (or read)” command should follow the “Address pointer set” and address pointer is automatically increment by + 1 after each data. After sending (or receiving) all data “Auto reset” is necessary to return normal operation because all data is regarded “Display data” and no command can be accepted in the auto mode.

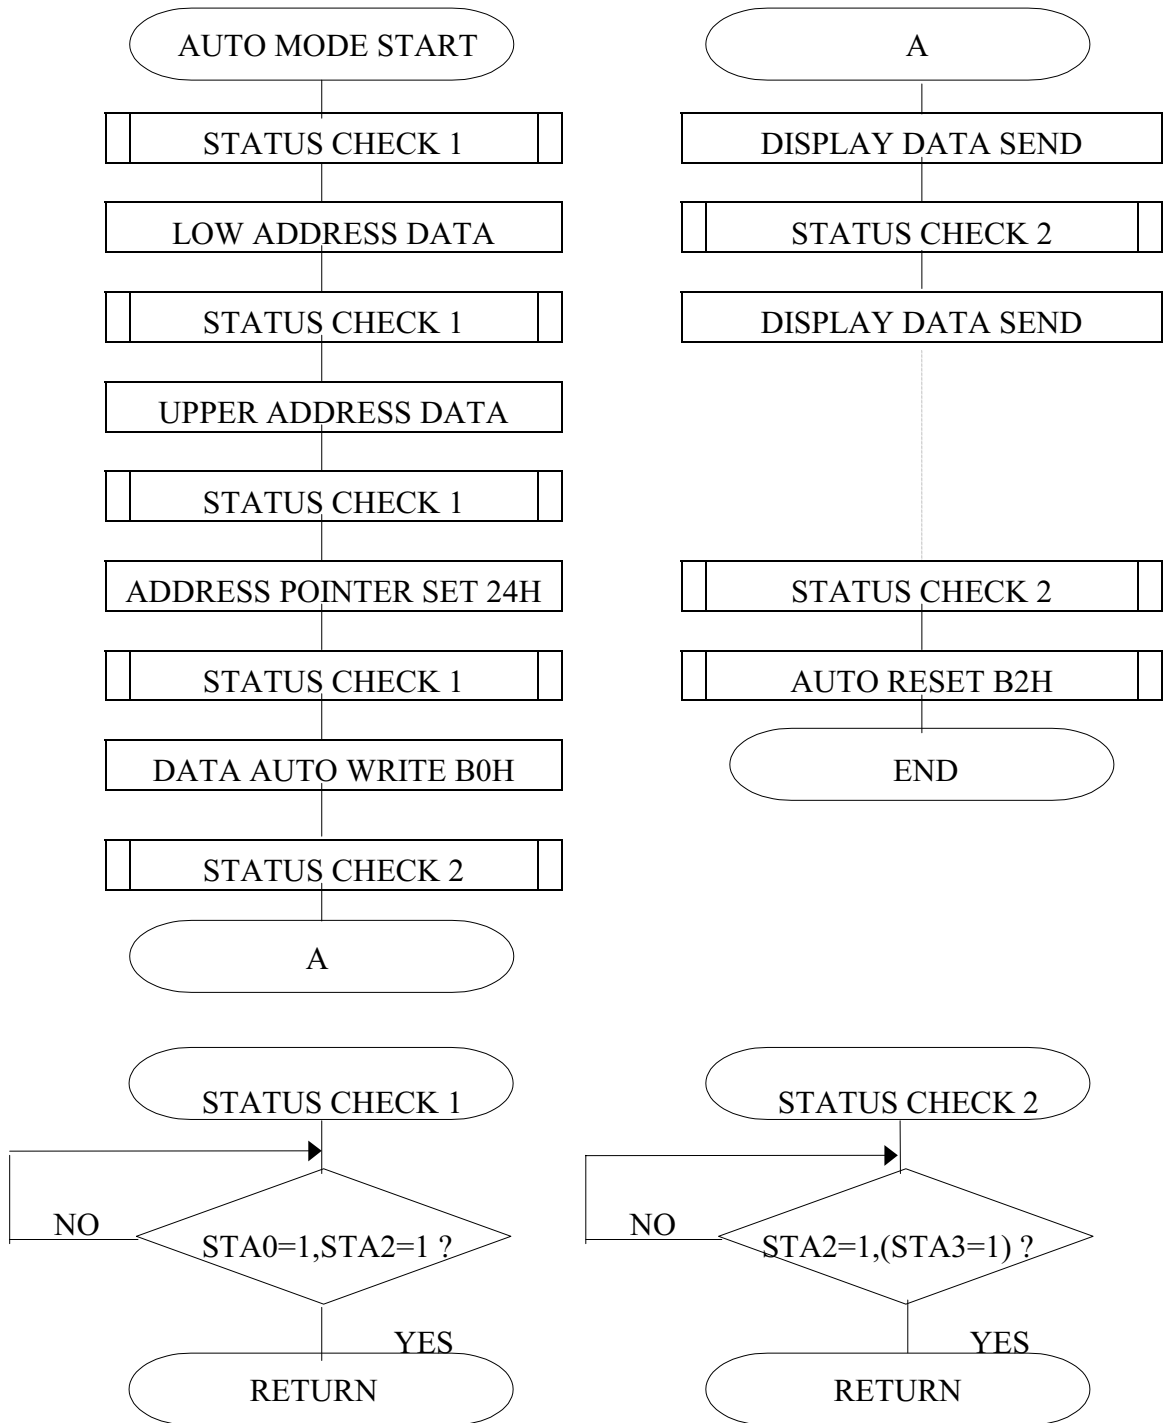

**POWERTIP TECHNOLOGY CORPORATION**

DISPLAY DEVICES FOR BETTER ELECTRONIC DESIGN

Note : Status check for auto mode (STA2, STA3 should be checked between each data.  
 Auto reset should be performed after checking STA3=1 (STA2=1).  
 Please refer following flow chart.

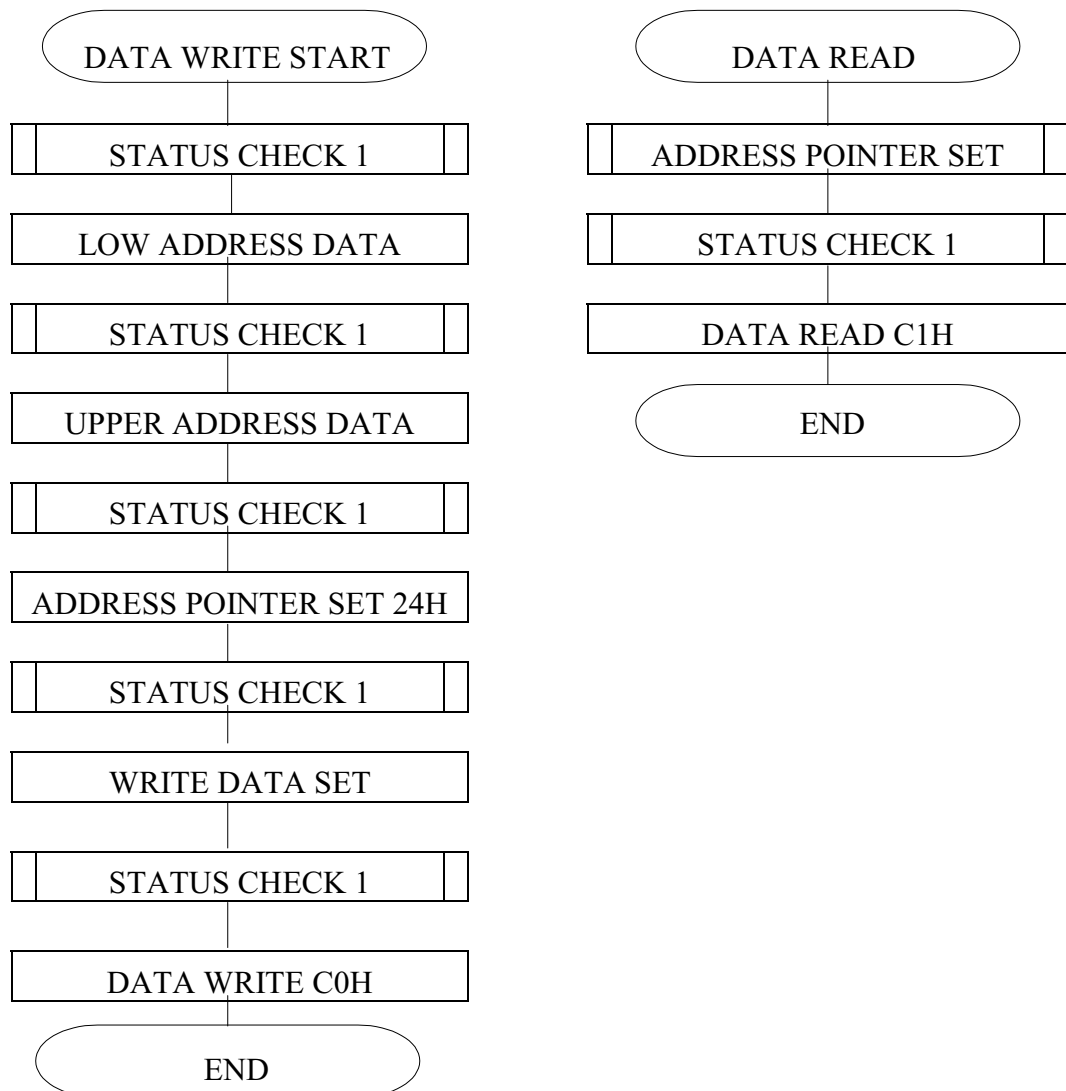

## 7.Data read write

Code	Hex.	Function	Operand
11000000	C0H	Data write and ADP increment	Data
11000001	C1H	Data read and ADP increment	-
11000010	C2H	Data write and ADP decrement	Data
11000011	C3H	Data read and ADP decrement	-
11000100	C4H	Data write and ADP nonvariable	Data
11000101	C5H	Data read and ADP nonvariable	-

This command is used for data write from MPU to external display RAM, and data read from external display RAM to MPU. Data write/data read should be executed after setting address by address pointer set command. Address pointer can be automatically increment or decrement by setting this command.

Note: This command is necessary for each 1 byte data.

Please refer following flow chart.

**POWERTIP TECHNOLOGY CORPORATION**

DISPLAY DEVICES FOR BETTER ELECTRONIC DESIGN

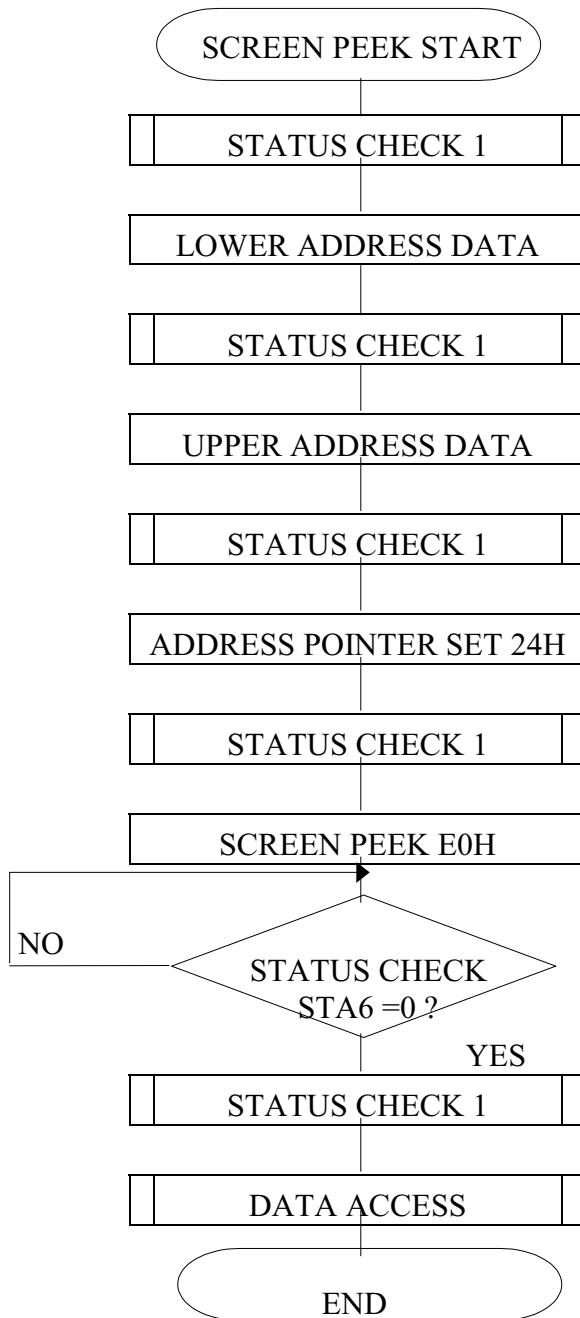

**8.Screen peek**

Code	Hex.	Function	Operand
11100000	E0H	screen peek	-

This command is used to transfer displayed 1 byte data to data stack, and this 1 byte data can be read from MPU by data access. The logical combination data of text and graphic display on LCD screen can be read by this command.

The status (STA6) should be checked just after “Screen peek” command. If the address determined by “Address pointer set” command is not in graphic area, this command ignored and status flag (STA6) is set.

Please refer following flow chart.

**POWERTIP TECHNOLOGY CORPORATION**

DISPLAY DEVICES FOR BETTER ELECTRONIC DESIGN

**9.Screen copy**

Code	Hex.	Function	Operand
11101000	E8H	screen copy	-

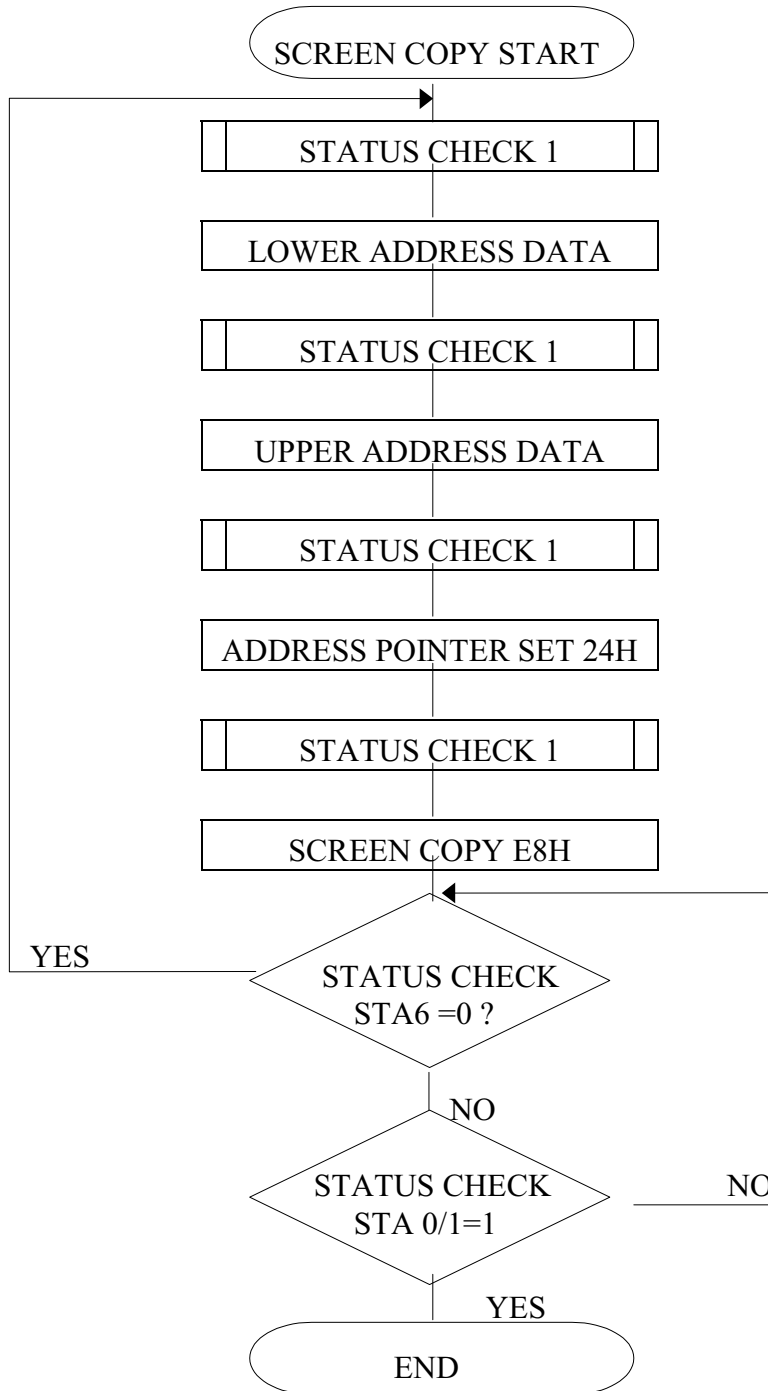

This command is used to copy displayed 1 line data to graphic area. The start point of 1 line data in the screen is determined by the address pointer.

Note: (1) In attribute function, this command is invalid.

(Because attribute data is in the graphic area.)

(2) In case of 2 screen drive, this command is invalid. (Because T693C cannot separate upper screen data and lower screen data.)

Please refer following flow chart.

**POWERTIP TECHNOLOGY CORPORATION**

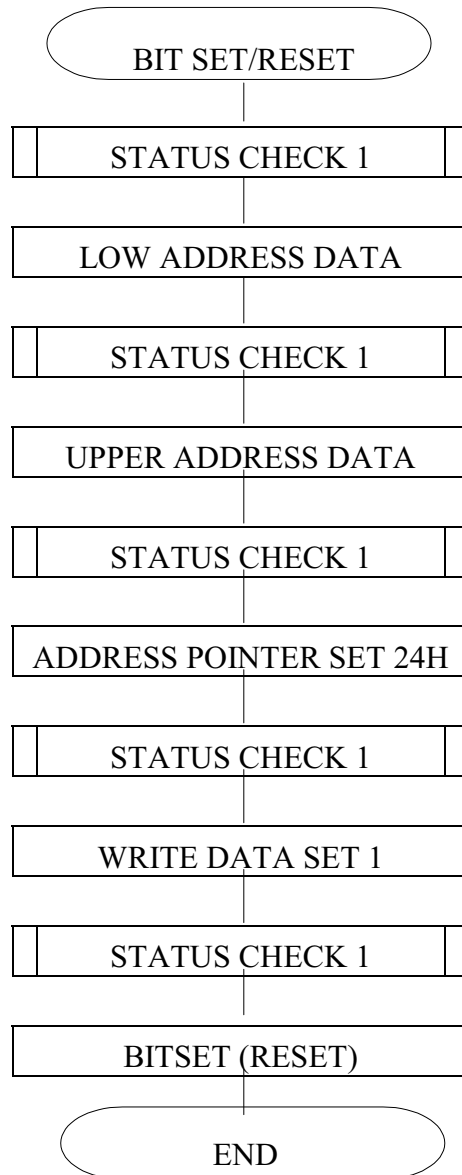

DISPLAY DEVICES FOR BETTER ELECTRONIC DESIGN

**10.Bit set/reset**

Code	Function	Operand
11110xxx	bit reset	-
11111xxx	bit set	-
1111x000	bit 9 (LSB)	-
1111x001	bit 1	-
1111x010	bit 2	-
1111x011	bit 3	-
1111x100	bit 4	-
1111x101	bit 5	-
1111x110	bit 6	-
1111x111	bit 7 (MSB)	-

This command is used to set or reset a bit of 1 byte is specified by address pointer. Plural bits in the 1 byte data cannot be set/reset at a time.

Please refer following flow chart.
