

Dual Picoampere Input Current Bipolar Op Amp

AD706

FEATURE

HIGH DC PRECISION
50 μV max Offset Voltage
0.6 μV/°C max Offset Drift
110 pA max Input Bias Current

LOW NOISE

0.5 μV p-p Voltage Noise, 0.1 Hz to 10 Hz

LOW POWER

750 μA Supply Current
Available in 8-Lead Plastic Mini-DIP, Hermetic Cerdip
and Surface Mount (SOIC) Packages
Available in Tape and Reel in Accordance with
EIA-481A Standard

Single Version: AD705, Quad Version: AD704

PRIMARY APPLICATIONS Low Frequency Active Filters Precision Instrumentation Precision Integrators

PRODUCT DESCRIPTION

The AD706 is a dual, low power, bipolar op amp that has the low input bias current of a BiFET amplifier, but which offers a significantly lower I_B drift over temperature. It utilizes superbeta bipolar input transistors to achieve picoampere input bias current levels (similar to FET input amplifiers at room temperature), while its I_B typically only increases by 5× at 125°C (unlike a BiFET amp, for which I_B doubles every 10°C for a 1000× increase at 125°C). The AD706 also achieves the microvolt offset voltage and low noise characteristics of a precision bipolar input amplifier.

Since it has only 1/20 the input bias current of an OP07, the AD706 does not require the commonly used "balancing" resistor. Furthermore, the current noise is 1/5 that of the OP07, which makes this amplifier usable with much higher source impedances. At 1/6 the supply current (per amplifier) of the OP07, the AD706 is better suited for today's higher density boards.

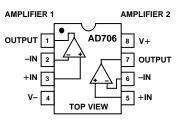

The AD706 is an excellent choice for use in low frequency active filters in 12- and 14-bit data acquisition systems, in precision instrumentation and as a high quality integrator. The AD706 is internally compensated for unity gain and is available in five performance grades. The AD706J and AD706K are rated over the commercial temperature range of 0°C to $+70^{\circ}\text{C}$. The AD706A and AD706B are rated over the industrial temperature range of -40°C to $+85^{\circ}\text{C}$.

REV. C

Information furnished by Analog Devices is believed to be accurate and reliable. However, no responsibility is assumed by Analog Devices for its use, nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Analog Devices.

CONNECTION DIAGRAM

Plastic Mini-DIP (N) Cerdip (Q) and Plastic SOIC (R) Packages

The AD706 is offered in three varieties of an 8-lead package: plastic mini-DIP, hermetic cerdip and surface mount (SOIC). "J" grade chips are also available.

PRODUCT HIGHLIGHTS

- 1. The AD706 is a dual low drift op amp that offers BiFET level input bias currents, yet has the low I_B drift of a bipolar amplifier. It may be used in circuits using dual op amps such as the LT1024.
- 2. The AD706 provides both low drift and high dc precision.
- 3. The AD706 can be used in applications where a chopper amplifier would normally be required but without the chopper's inherent noise.

NOTES

CMRR match is the difference between $\frac{\Delta V_{OS} \# 1}{\Delta V_{CM}}$ for amplifier #1 and $\frac{\Delta V_{OS} \# 2}{\Delta V_{CM}}$ for amplifier #2 expressed in dB.

PSRR match is the difference between $\frac{\Delta V_{OS} \# 1}{\Delta V_{SUPPLY}}$ for amplifier #1 and $\frac{\Delta V_{OS} \# 2}{\Delta V_{SUPPLY}}$ for amplifier #2 expressed in dB.

All min and max specifications are guaranteed. Specifications subject to change without notice.

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD706 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

REV. C -3-

¹Bias current specifications are guaranteed maximum at either input.

²Input bias current match is the difference between corresponding inputs (I_B of -IN of Amplifier #1 minus I_B of -IN of Amplifier #2).

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

²Specification is for device in free air:

⁸⁻Lead Plastic Package: $\theta_{JA}=100^{\circ} C/Watt$

 $^{^3}$ The input pins of this amplifier are protected by back-to-back diodes. If the differential voltage exceeds ± 0.7 volts, external series protection resistors should be added to limit the input current to less than 25 mA.

Figure 24 shows an in-amp circuit that has the obvious advantage of requiring only one AD706, rather than three op amps, with subsequent savings in cost and power consumption. The transfer function of this circuit (without $R_{\rm G}$) is:

$$V_{OUT} = (V_{IN\#1} - V_{IN\#2}) \left(1 + \frac{R4}{R3}\right)$$

for
$$R1 = R4$$
 and $R2 = R3$

Input resistance is high, thus permitting the signal source to have an unbalanced output impedance.

*OPTIONAL INPUT PROTECTION RESISTOR FOR GAINS GREATER THAN 100 OR INPUT VOLTAGES EXCEEDING THE SUPPLY VOLTAGE.

Figure 24. A Two Op-Amp Instrumentation Amplifier Furthermore, the circuit gain may be fine trimmed using an optional trim resistor, $R_{\rm G}$. Like the three op-amp circuit, CMR

increases with gain, once initial trimming is accomplished—but CMR is still dependent upon the ratio matching of Resistors R1 through R4. Resistor values for this circuit, using the optional gain resistor, $R_{\rm G}$, can be calculated using:

$$R1 = R4 = 49.9 \text{ k}\Omega$$

$$R2 = R3 = \frac{49.9 \text{ k}\Omega}{0.9 \text{ G} - 1}$$

$$R_G = \frac{99.8 \text{ k}\Omega}{0.06 \text{ G}}$$

where G = Desired Circuit Gain

Table I provides practical 1% resistance values. (Note that without resistor $R_G,~R2$ and $R3=49.9~k\Omega/G{-}1.)$

Table I. Operating Gains of Amplifiers A1 and A2 and Practical 1% Resistor Values for the Circuit of Figure 24

Circuit Gain	Gain of A1	Gain of A2	R2, R3	R1, R4
1.10	11.00	1.10	499 kΩ	49.9 kΩ

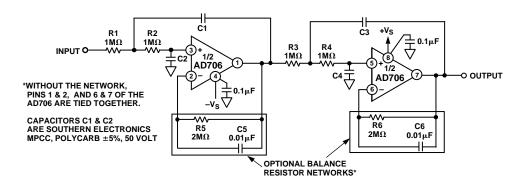

Figure 25. A 1 Hz, 4-Pole Active Filter

A 1 Hz, 4-Pole, Active Filter

Figure 25 shows the AD706 in an active filter application. An important characteristic of the AD706 is that both the input bias current, input offset current and their drift remain low over most of the op amp's rated temperature range. Therefore, for most applications, there is no need to use the normal balancing resistor. Adding the balancing resistor enhances performance at high temperatures, as shown by Figure 26.

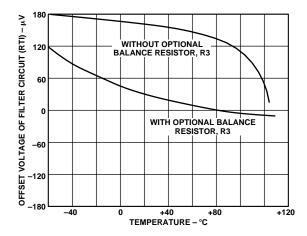

Figure 26. V_{OS} vs. Temperature Performance of the 1 Hz Filter

Table II. 1 Hz, 4-Pole, Low Pass Filter Recommended Component Values

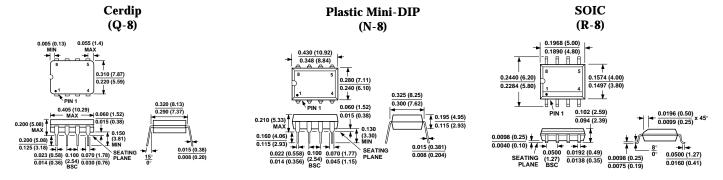

Desired Low Pass Response	Section 1 Frequency (Hz)	Q	Section 2 Frequency (Hz)	Q	C1 (µF)	C2 (µF)	C3 (μF)	C4 (μF)
Bessel	1.43	0.522	1.60	0.806	0.116	0.107	0.160	0.0616
Butterworth	1.00	0.541	1.00	1.31	0.172	0.147	0.416	0.0609
0.1 dB Chebychev	0.648	0.619	0.948	2.18	0.304	0.198	0.733	0.0385
0.2 dB Chebychev	0.603	0.646	0.941	2.44	0.341	0.204	0.823	0.0347
0.5 dB Chebychev	0.540	0.705	0.932	2.94	0.416	0.209	1.00	0.0290
1.0 dB Chebychev	0.492	0.785	0.925	3.56	0.508	0.206	1.23	0.0242

NOTE

Specified Values are for a -3 dB point of 1.0 Hz. For other frequencies simply scale capacitors C1 through C4 directly, i.e.: for 3 Hz Bessel response, C1 = $0.0387~\mu F$, C2 = $0.0357~\mu F$, C3 = $0.0533~\mu F$, C4 = $0.0205~\mu F$.
