

**FEATURES**

- Low Cost Integrated Monolithic GaAs Amplifier With Step Attenuator
- Attenuation Range: 0-30 dB, Adjustable In 2dB Increments Via a 4 Wire Parallel Control
- Meets DOCSIS Distortion Requirements at +58dBmV Output Signal Level
- Low Distortion and Low Noise
- Low Signal toNoise Ratio at All Gain Levels
- Frequency Range: 5-100 MHz
- 5 Volt Operation
- RoHS-Compliant Package Option

**APPLICATIONS**

- MCNS/DOCSIS Compliant Cable Modems
- CATV Interactive Set-Top Box
- OpenCable Set-Top Box
- Fiber Nodes
- Cable Modem Termination Systems (CMTS)

**PRODUCT DESCRIPTION**

The ARA05050 is a GaAs IC designed to provide the reverse path amplification and output level control functions in a CATV Set-Top Box or Cable Modem. It incorporates a digitally controlled precision step attenuator that is preceded by an ultra low noise amplifier stage, and followed by an ultra-linear output driver amplifier. This device is capable of meeting the MCNS/DOCSIS requirements for harmonic

performance at a +58dBmV output level while requiring only a single polarity +5V supply. Both the input and the output are single-ended and matched to 75 Ohms. The precision attenuator provides up to 30 dB of attenuation in 2 dB increments. The ARA05050 is offered in a 28-pin SSOP package that features a heat slug on the bottom of the package, and is available in a RoHS-compliant option.

## Notes:

(1) All N/C pins should be grounded.

(2) Pins should be AC-coupled. No external DC bias should be applied.

(3) Pins should be AC-grounded. No external DC bias should be applied.

(4) Pins should be grounded or pulled to ground through a resistor. No external DC bias should be applied.

## ELECTRICAL CHARACTERISTICS

Table 2: Absolute Minimum and Maximum Ratings

PARAMETER	MIN	MAX	UNIT
Analog Supply: V <sub>SUP</sub> (pins 4, 12, 18)	0	9	VDC
Amplifier Reference Voltages (pins 5, 19)	-2.5	$\frac{V_{SUP}}{2}$	VDC
RF Power at Amplifier Inputs (pins 10, 24)	-	+60	dBmV
Attenuator Controls (pins 13, 14, 15, 16)	0	6	V
Storage Temperature	-55	+200	°C
Soldering Temperature	-	260	°C
Soldering Time	-	5	Sec

Stresses in excess of the absolute ratings may cause permanent damage. Functional operation is not implied under these conditions. Exposure to absolute ratings for extended periods of time may adversely affect reliability.

Notes:

1. Pins 3 and 26 should be AC-coupled. No external DC bias should be applied.
2. Pins 10, 11, 24 and 25 should be grounded or pulled to ground through a resistor. No external DC bias should be applied.
3. Pins 6, 7, 8, 9, 20, 21, 22 and 23 should be AC-grounded. No external DC bias should be applied.

Table 3: Operating Ranges

PARAMETER	MIN	TYP	MAX	UNIT
Amplifier Supply: V <sub>DD</sub> (pins 4, 18)	4.5	5	7	VDC
Attenuator Supply: V <sub>ATTN</sub> (pin 12)	V <sub>DD</sub> -0.5	5	7	VDC
Attenuator Controls (pins 13, 14, 15, 16)	0	-	5.5	V
Amplifier Reference Voltages (pins 5, 19)	-	1.75	-	VDC
Case Temperature	-40	25	85	°C

The device may be operated safely over these conditions; however, parametric performance is guaranteed only over the conditions defined in the electrical specifications.

**Table 4: DC Electrical Specifications****T<sub>A</sub>=25°C; V<sub>DD</sub>, V<sub>ATTN</sub> = +5.0 VDC**

PARAMETER	MIN	TYP	MAX	UNIT
Amplifier A1 Current (pin 4)	-	75	95	mA

**APPLICATION INFORMATION**

**Printed Circuit Board Layout Considerations**

The ARA05050 is a high-performance RF device. Special consideration must be given to certain features of the the printed circuit board layout, as they can affect the RF performance of the IC. Refer to the ANADIGICS application note “CATV Reverse Amp w/ Step Attenuator” for more details.

**Amplifier Enable / Disable**

The ARA05050 includes two amplification stages that each can be shut down through external control pins  $V_{REF1}$  and  $V_{REF2}$  (pins 5 and 19, respectively.) By applying a typical bias of 1.75 Volts to these pins, the amplifiers are enabled. In order to fully disable an amplifier, its control pin requires a negative bias of -1.5 to -2.0 Volts.

**Amplifier Bias Current**

The  $I_{SET}$  pins (11 and 25) set the bias current for the amplification stages. Grounding these pins results in the maximum possible current. By placing a resistor from the pin to ground, the current can be reduced. The recommended bias conditions use the configuration shown in the test circuit schematic in Figure 4.

**Thermal Layout Considerations**

The device package for the ARA05050 features a heat slug on the bottom of the package body. Use of the heat slug is an integral part of the device design. Soldering it to the ground plane of the PC board will ensure the lowest possible thermal resistance for the device, and will result in the longest MTF (mean time to failure.)

A PC board layout that optimizes the benefits of the heat slug is shown in Figure 13. The via holes located under the body of the device must be plated through to a ground plane layer of metal, in order to provide sufficient thermal conductivity. The recommended solder mask outline is shown in Figure 14.

**ESD Sensitivity**

Electrostatic discharges can cause permanent damage to this device. Electrostatic charges accumulate on test equipment and the human body, and can discharge without detection. Proper precautions and handling are strongly recommended. Refer to the ANADIGICS application note on ESD precautions.
