

OV7620 SINGLE-CHIP CMOS VGA COLOR DIGITAL CAMERA

Features

- 326,688 pixels, 1/3" lens, VGA / QVGA format
- Read out - progressive / Interlace
- Data format - YCrCb 4:2:2, GRB 4:2:2, RGB Raw Data
- 8/16 bit video data: CCIR601, CCIR656, ZV port
- Video Timing - 525 line, 30 fps
- Wide dynamic range, anti-blooming, zero smearing
- SCCB (Serial Camera Control Bus) interface
- Electronic exposure / Gain / white balance control
- Image enhancement - brightness, contrast, gamma, saturation, sharpness, window, etc.
- Internal / external synchronization scheme
- Frame exposure / line exposure option
- 5 Volt operation, low power dissipation.

General Description

OV7620 is a highly integrated high resolution (640x480) Interlaced / Progressive Scan CMOS digital color / black&white video camera chip. The digital video port supports 60Hz YCrCb 4:2:2 16Bit / 8 Bit format, ZV Port output format, RGB raw data 16Bit/8Bit output format and CCIR601/CCIR656 format. The built-in SCCB interface provides an easy way of controlling the built-in camera functions.

SECTION 1

PRODUCT OVERVIEW

OV7620 is a highly integrated high resolution (640x480) Interlaced / Progressive Scan CMOS digital color / black&white video camera chip. The digital video port supports 60Hz YCrCb 4:2:2 16Bit / 8 Bit format, ZV Port output format, RGB raw data 16Bit/8Bit output format and CCIR601/CCIR656 format. The built-in SCCB (Serial Camera Control Bus) interface provides an easy way of controlling the built-in camera functions.

1.1 FEATURES

- Single chip digital color/black&white video camera chip.
- Scanning - Interlaced / Progressive Scan.
- Format - 1/3" lens compatible.
- Image area -4.86X 3.64mm.
- Total active pixel elements - (H)664 x (V)492 square pixel.
- Default active pixel element -(H)640 x (V)480.
- Pixel size: 7.6 x 7.6um.
- 10Bit two channel internal A/D Converter and 8/10 Bit Output.
- PCLK and HREF polarity programmable.
- Digital Output format -
 - YCrCb 16bit/8bit selectable
 - 60Hz 16 Bit YCrCb 4:2:2 - 640x480
 - 60Hz 8 Bit YCrCb 4:2:2 - 640x480
 - RGB Raw Data Digital Output 16Bit/8Bit selectable
- Two-line output:
 - Y Channel: B G B G B G ...
 - UV Channel: G R G R G R ...
 - Two-line alternate output:
 - Y Channel: G G G G G G ...
 - UV Channel: B R B R B R ...
 - One-line output, use Y Channel only, effective only in Progressive Scan Mode
 - 1st line: B G B G B G B G...
 - 2nd line: G R G R G R G R ...
- CCIR601 /CCIR656 standard.
- YCrCb or YUV output format to support TV or monitor display
- ZV Port YUV 16 Bit format.
- QVGA format(320x240).
- Y/UV or RGB output byte MSB and LSB swap.
- SCCB interface, support fast mode: 400 kBit/s.
- External Field Sync input.
- External Horizontal / Vertical Sync input format, OV7620 worked as slave chip.
- Support external micro-controller and RAM interface
- Progressive Scan mode: support whole-frame exposure.
- Programmable frame rate - 0.5 to 30fps.
- Electronic shutter setting (use 27Mhz crystal and default clock rate).
 - Interlaced: 1/60 to $1/15734$ (s)

- Progressive Scan: 1/30 to 1/15734(s)
- AGC (+24dB) - auto / programmable.
 - PreAmp Gain 6/12 db.
 - Auto-Exposure-ratio programmable.
 - White balance - auto/programmable.
 - Auto-White-Balance-ratio programmable.
 - Brightness & contrast adjustment.
 - Color Saturation adjustment.
 - Aperture correction.
 - Multiple gamma correction curve selection.
 - Multiple luminance gamma correction curve selection.
 - S/N ratio > 48 dB.
 - Software/Hardware Reset.
 - Software/hardware power saving control
 - Minimum illumination 2.5 lux at f1.4 (3000k).
 - Optical fill factor is 40%.
 - Supply: 5 volt for analog and Digital circuit;5volt or 3.3volt for digital interface.
 - Power consumption < 120 mW.
 - Power-save mode < 10 uA.
 - Chip SCCB ID: 0 1 0 CS2 CS1 CS0 1 R/W (CS2 CS1 CS0 select by PIN when power-on, default 0).
 - 48pin package.

1.2 Pin Assignments

Table 1: Pin Descriptions(Pin type and default level: I-1: digital input+10k pull up; I-0: digital input +10k pull down, XI/XO; xtal IO; /Secondary functions are set during power up; O/I: digital CMOS level output Bias: power supply bias.).

| Pin # | Name | Class | Function |
|--------------|--------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | SVDD | Bias | Sensing Power (+5V) pins. |
| 8, 14,44 | AVDD | Bias | Analog Power (+5V) pins. |
| 29 | DVDD | Bias | Digital Power (+5V) pins. |
| 32 | DOVDD | Bias | Digital I/O Power (+5V / +3.3V) pins. |
| 48 | SGND | Bias | Sensing ground connections. Connect to supply common |
| 6, 7, 15, 43 | AGND | Bias | Analog ground connections. Connect to supply common |
| 30 | DGND | Bias | Digital ground connection. Connect to supply common |
| 31 | DOGND | Bias | Digital Output ground connection. |
| 2 | RESET | I | Chip reset, "high" active. |
| 3 | AGCEN/RAMINT | I-I | AGCEN =1 enables the Auto Gain Control. AGCEN = 0 disables it. This pin setting is effective when pin SBB = 1. RAMINT=1 initializes frame transfer. |
| 4 | FREX | I | Frame exposure control input, effective in progressive scan only. The positive width of FREX defines the exposure time. |
| 5 | VrEQ | CAP | Internal voltage reference. Requires an 0.1uF decoupling capacitor to ground. |
| 9 | PWDN | I-0 | PWDN =1 puts chip in power down (sleep) mode. |
| 10 | VrS | CAP | Internal voltage reference. Requires an 0.1uF decoupling capacitor to ground. |
| 11 | VcCHG | CAP | Internal voltage reference. Requires an 1.0uF decoupling capacitor to ground. |
| 12 | SBB | I | SBB = 1 selects the power-up method of programming the internal functions. SBB = 0 selects the SCCB pin programming method. Results of the power-up method can only be changed by a new power-up or reset sequence. |
| 13 | VTO | O | Video Test Output (NTSC) |
| 16 | VSYNC/CSYS | O/I | VSYNC: Vertical sync output. This pin is asserted high during several scan lines in the vertical sync period. CSYS: Composite Sync. When not using SCCB, a 10k pull up changes pin 42(CHSYNC) to CSYS. |
| 17 | FODD/SRAM | O/I | FODD: Odd field flag. Asserted high during the odd field, low during the even field. SRAM: External SRAM |
| 18 | HREF/VSFRAM | O/I | HREF: Horizontal window reference output. HREF is high during the active pixel window, otherwise low. VSFRAM: Vertical Sync Frame. |
| 19 | UV7/B8 | O/I | UV7: Digital output UV bus. UV7 used for 16-bit operation for outputting chrominance data. B8: Switch for 8 bit mode luminance/Chroma tristate. Default is 16 bit mode. |
| 20 | UV6/BPCLR | O/I | UV6: Digital output UV bus. UV6 used for 16-bit operation for outputting chrominance data. BPCLR: Bypass RGB color matrix. |
| 21 | UV5/MIR | O/I | UV5: Digital output UV bus. UV5 used for 16-bit operation for outputting chrominance data. MIR: Mirror. |

| Pin # | Name | Class | Function |
|--------|--------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 22 | UV4/SLAEN | O/I | UV4: Digital output UV bus. UV4 used for 16-bit operation for outputting chrominance data. SLAEN: Slave Enable. |
| 23 | UV3/ECLKO | O/I | UV3: Digital output UV bus. UV3 used for 16-bit operation for outputting chrominance data. ECLKO: Swap clock output - changes pin 17(FODD) to XCLK out. |
| 24 | UV2/QVGA | O/I | UV2: Digital output UV bus. UV2 used for 16-bit operation for outputting chrominance data. QVGA: QVGA format (320x240) |
| 25 | UV1/CC656 | O/I | UV1: Digital output UV bus. UV1 used for 16-bit operation for outputting chrominance data. CC656: CCIR 656 mode. |
| 26 | UV0/GAMDIS | O/I | UV0: Digital output UV bus. UV0 used for 16-bit operation for outputting chrominance data. GAMDIS: Disables Chroma Gamma (RGB). |
| 27, 28 | XCLK1, XCLK2 | XO, XI | XCLK1 and XCLK2 are the input/output of the on-chip video oscillator. Nominal crystal clock frequency is 27MHz. If an external clock is used, input to XCLK1, leave XCLK2 unconnected. |
| 33 | PCLK/OUTX2 | O/I | PCLK: Pixel clock output. By default, data is updated at the falling edge of PCLK and is stable at its rising edge. PCLK runs at the pixel rate in 16-bit bus operations and twice the pixel rate in 8-bit bus operations OUTX2: Doubles current output. |
| 34 | Y7/CSO | O/I | Y7: Digital output Y bus. In a 16-bit operation, the luminance data is clocked out of this bus at the rate of one byte per pixel. In 8-bit operation, the luminance data and the chrominance data is multiplexed to this bus. CSO: ID configuration bit for the SCCB slave ID. |
| 35 | Y6/CS2 | O/I | Y6: Digital output Y bus. In a 16-bit operation, the luminance data is clocked out of this bus at the rate of one byte per pixel. In 8-bit operation, the luminance data and the chrominance data is multiplexed to this bus. CS2: ID configuration bit for the SCCB slave ID. |
| 36 | Y5/SHARP | O/I | Y5: Digital output Y bus. In a 16-bit operation, the luminance data is clocked out of this bus at the rate of one byte per pixel. In 8-bit operation, the luminance data and the chrominance data is multiplexed to this bus. SHARP: Enable Analog Sharpness. |
| 37 | Y4/CS1 | O/I | Y4: Digital output Y bus. In a 16-bit operation, the luminance data is clocked out of this bus at the rate of one byte per pixel. In 8-bit operation, the luminance data and the chrominance data is multiplexed to this bus. CS1: ID configuration bit for the SCCB slave ID. |
| 38 | Y3/RAW | O/I | Y3: Digital output Y bus. In a 16-bit operation, the luminance data is clocked out of this bus at the rate of one byte per pixel. In 8-bit operation, the luminance data and the chrominance data is multiplexed to this bus. RAW: Raw Data. |
| 39 | Y2/G2X | O/I | Y2: Digital output Y bus. In a 16-bit operation, the luminance data is clocked out of this bus at the rate of one byte per pixel. In 8-bit operation, the luminance data and the chrominance data is multiplexed to this bus. G2X: Gain 2X. |

| Pin # | Name | Class | Function |
|-------|-----------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 40 | Y1/PROG | O/I | Y1: Digital output Y bus. In a 16-bit operation, the luminance data is clocked out of this bus at the rate of one byte per pixel. In 8-bit operation, the luminance data and the chrominance data is multiplexed to this bus. PROG: Progressive Scan Mode. |
| 41 | Y0/CBAR | O/I | Y0: Digital output Y bus. In a 16-bit operation, the luminance data is clocked out of this bus at the rate of one byte per pixel. In 8-bit operation, the luminance data and the chrominance data is multiplexed to this bus. CBAR: Color Bar Test Pattern. |
| 42 | CHSYNC/BW | O/I | CHSYNC: Digital output for either composite sync or horizontal sync signal. BW: Enables Black & White. |
| 45 | SIO-1 | I | SCCB Serial clock input with schmitt trigger. |
| 46 | SIO-0 | IO | SCCB Serial data, input with schmitt trigger. |
| 47 | MID | I-0 | Multiple SCCB slave ID enable. MID = 1 SCCB slave ID is configurable through power up setting in CS(2:0) MID = 0 SCCB slave ID is preset to 42H/43H. |

1.3 CHIP OPERATION

Referring to FIG 1.1, OV7620 includes a 664x492 resolution image array, an analog signal processor, dual 10bit A/D converters, analog video mux, digital data formatter and video port, SCCB interface with its registers, the digital controls including timing block, exposure block and white balance.

FIG 1.1 OV7620Block Diagram

OV7620 is a 1/3 inch CMOS imaging device. The sensor contains approximately 326,688 pixels. It is based on a field integration read-out system with line-by-line transfer and an electronic shutter with synchronous pixel read out scheme. The color filter of the sensor consists of primary color RG/GB array arranged in line alternating fashion.

The majority of signal processing is performed in the analog processing block, which does color separation, matrixing, AGC, gamma correction, color correction, color balance, black level calibration, knee smooth, aperture correction, controls for the luminance and chrominance picture and anti-alias filtering. The analog video signals are based on the formula:

$$Y = 0.59G + 0.31R + 0.11B; \text{ where } R, G, B \text{ is the equivalent color components in each pixel}$$
$$U = R - Y;$$
$$V = B - Y;$$

Another output data format is YCrCb, its formula is as follows:

$$Y = 0.59G + 0.31R + 0.11B$$
$$Cr = 0.713 \times (R - Y)$$
$$Cb = 0.564 \times (B - Y)$$

The YCrCb /RGB Raw Data signal is fed to two 10 bit A/D converters, one for the Y/R&G channel, one is shared by Cr&Cb / B&G channels. The A/D converted data stream is further conditioned in the digital formatter, finally the 16bit or 8 bit data muxing is done in the digital video port.

The on-chip 10 bit A/D can operate up to 13.5 MSPS, since it is fully synchronous to the pixel rate, the conversion rate always follows the frame rate. An A/D black-level-calibration circuitry ensures the black level of Y/RGB is translated to value 16, and the peak white level is limited to 240; CrCb black level is 128, Peak/Bottom is 240/16. RGB raw data output range is 16/240, 0 & 255 reserved for sync flag. Also OV7620 support non-CCIR standard output range, that is 1/254, 0 and 255 are reserved for sync flag.

The computation in the electronic exposure control is based on the brightness of the full image. The exposure algorithm is optimized for normal scene which assuming the subject is well-lit relative to the background. In case of a different backlight condition, there is also a AEC White/Black ratio selection register, which can be used as AEC algorithm adjustment to get special image. Along with the AEC is the on chip AGC which can boost gain up to 24dB if needed. To achieve proper color temperature, auto or manual white balance control is also available. There is a separate saturation, brightness contrast and sharpness adjustment for further fine tuning of the picture quality. OV7620 provide a set of register to control White Balance ratio register which can be used as increase/decrease image field Red/Blue component ratio. In most case, the default setting may be sufficient.

The windowing feature allows the user to size the window according to their need. The window is sizable from 4X2 to 664x492 and can be placed anywhere inside the 664X492 boundary. Noted this function does not change the frame rate or data rate, it simply change the assertion of the **HREF** to match with the horizontal and vertical region that is programmed by the user. A typical application for this is hardware zooming, and panning. Default output window is 640x480.

The digital video port offers 16 bit 4:2:2 format complying to the 60Hz **CCIR601** timing standard. OV7620 also supports 8 bit data format in Cb Y Cr Y order by using port Y only and running at twice the pixel rate while the port UV is inactive. Other than the 16 bit data bus, OV7620 supplies standard video timing signals such as **VSYNC**, **HREF**, **PCLK**, **FODD**, **CHSYNC**.

OV7620 support standard **ZV** Port Interface Timing. It provides **VSYNC**, **CHSYNC**, **PCLK** and 16 Bit data bus: **Y<7:0>** and **UV<7:0>**. **PCLK** rising edge clock data bus into **ZV** port.

To decrease data transfer rate while high resolution image unnecessary, OV7620 provide a solution, that is it can output **QVGA** resolution image. This mode decrease pixel rate one half. The resolution default value is 320x240 and can be programmable. Every line only output one half data. For Interlaced Mode, all field line output (320), for Progressive Scan Mode, only one half line data output.

The digital video port also offer **RGB Raw Data** 16 Bit/8 Bit format. The output sequence is matched to OV7620 Color Filter Pattern, that is UV channel output sequence is G R G R ..., Y Channel output sequence is B G B G,....To 8 Bit RGB Raw data output format, just use Y channel and disable UV channel, output sequence is B G R G

OV7620 support **CCIR656** YCrCb 4:2:2 digital output format. The **SAV**(Start of Active Video) and **EAV**(End of Active Video) is just at the beginning and the end of **HREF** window. So the position of **SAV** and **EAV** is changing with active pixel window. Also you can get 8 bit **RGB raw data** with **SAV** and **EAV** information.

OV7620 support some flexible YUV output format. One is standard YUV 4:2:2. Another is U V sequence swap format, that means UV channel output V U V U ...(16 Bit) and V Y U Y ...(8 Bit). The 3rd format is Y/UV sequence swap in 8 Bit output, that is Y U Y V

OV7620 can be use as **black&white** camera. At this mode, it's vertical resolution will be higher than color mode. All data will be output from Y port and UV port will be tri-state. Data (Y/RGB) output rate is same as 16 Bit mode.

OV7620 can be programmable to swap Y/UV or RGB output byte MSB and LSB. Y7 - Y0 default sequence is Y7 is MSB and Y0 is LSB. When swap, Y7 is LSB and Y0 is MSB, relative middle bits are swapped.

An important factor about digital camera is how convenient the interface is, OV7620 has made the frame rate programmable and the A/D synchronous to the actual pixel rate. Essentially, it is a whole image capture system in a single chip. Since the internal AEC has a range of 1:260, and AGC have 24dB, for the most of applications, the camera can adjust itself to meet the lighting condition without user intervention.

OV7620 support hardware/software RESET function: when **RESET** pin tie to high, whole chip will be reset including all register. Hardware sleeping mode: when **PWDN** tie to high, chip clock will be stop and internal circuit reset except all SCCB register. Also there is a SCCB control software reset control register 12 bit 7, which is same as hardware **RESET** pin function.

OV7620 hardware reset time minimum is 1 ms.

OV7620 support hardware/software power saving mode. When the **PWDN** pin tie to high, whole chip will be set to power down status without any current consumption. For software power down control, all current set to zero except crystal circuit. In power down mode, all SCCB register value will be kept.

Two control mechanism have been built into OV7620: **A.** one time read-in of pin states at **power up** or **RESET** status, including hardware and software reset; **B.** SCCB interface. Two methods are mutually exclusive, only one is used at a time, selected by pin **SBB**. Method A has limited access to full chip features.

The power up reset method is a one time setting, the setting can not be altered later. The pins

used in the control are shared with the digital video port data bus. At power up, the video port is initially tri-stated, allowing the external pull-up/pull-down resistor to set the default operating conditions, 2048 clocks later the video port resumes normal function. The detail of the power up pin control method is explained in the individual pin out section.

SCCB interface provides full access to all the features. The detail is in the SCCB register set.

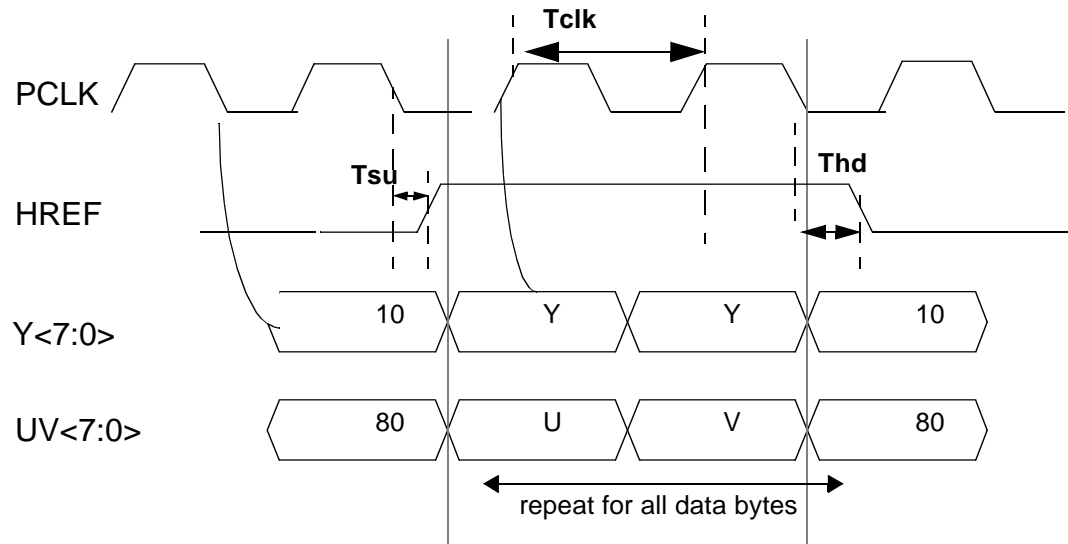

1.4 VIDEO FORMAT

1.5.1 Interlaced Mode 16 Bit Format (HREF total 242)

1.5.1.1 Default mode: In **ODD FIELD**, 1st HREF output UV channel is 2nd line: G₂₁ R₂₂ G₂₃ R₂₄... and Y channel is Row 1: B₁₁ G₁₂ B₁₃ G₁₄ 2nd HREF output UV channel output 4th line: G₄₁ R₄₂ G₄₃ R₄₄ ... and Y port output 3rd line: B₃₁ G₃₂ B₃₃ G₃₄ ... , so on. Data bus should be latched by PCLK rising edge and related to the exact physical position **In Even FIELD**, 1st HREF Y channel output B₃₁ G₃₂ B₃₃ G₃₄ ... and UV channel output G₂₁ R₂₂ G₂₃ R₂₄ ... 2nd HREF Y channel output B₅₁ G₅₂ B₅₃ G₅₄ ... and UV output G₄₁ R₄₂ G₄₃ R₄₄

1.5.1.2 YG mode: In **ODD FIELD**, 1st HREF Y channel output G₂₁ G₁₂ G₂₃ G₁₄ ... and UV channel is B₁₁ R₂₂ B₁₃ R₂₄ 2nd HREF Y channel output G₄₁ G₃₂ G₄₃ G₃₄ ... and UV channel output B₃₁ R₄₂ B₃₃ R₄₄ **In EVEN FIELD**, 1st HREF Y channel output G₂₁ G₃₂ G₂₃ G₃₄ ... and UV channel output B₃₁ R₂₂ B₃₃ R₂₄ ... 2nd HREF channel output G₄₁ G₅₂ G₄₃ G₅₄ ... and UV channel output B₅₁ R₄₂ B₅₃ R₄₄

1.5.2 Progressive Scan Mode 16 Bit Format (HREF total 484)

1.5.2.3 Default mode: 1st HREF UV channel output unstable data, Y output $B_{11} G_{12} B_{13} G_{14} \dots$ 2nd HREF UV channel output $G_{21} R_{22} G_{23} R_{24} \dots$, Y output $B_{11} G_{12} B_{13} G_{14} \dots$ 3rd HREF UV channel output $G_{21} R_{22} G_{23} R_{24} \dots$, Y output $B_{31} G_{32} B_{33} G_{34} \dots$. Every line data output twice.

1.5.2.4 YG mode: 1st HREF Y and UV output unstable data. 2nd HREF Y channel output $G_{21} G_{12} G_{23} G_{14} \dots$, UV output $B_{11} R_{22} B_{13} R_{24} \dots$ 3rd HREF Y is $G_{21} G_{32} G_{23} G_{34} \dots$, UV channel is $B_{31} R_{22} B_{33} R_{24} \dots$. Every line data output twice.

1.5.2.5 One line mode: 1st HREF Y channel output $B_{11} G_{12} B_{13} G_{14} \dots$, 2nd HREF Y channel output $G_{21} R_{22} G_{23} R_{24} \dots$, so on. UV channel tri-state.

1.5.3 Interlaced Mode 8 Bit (242 HREF)

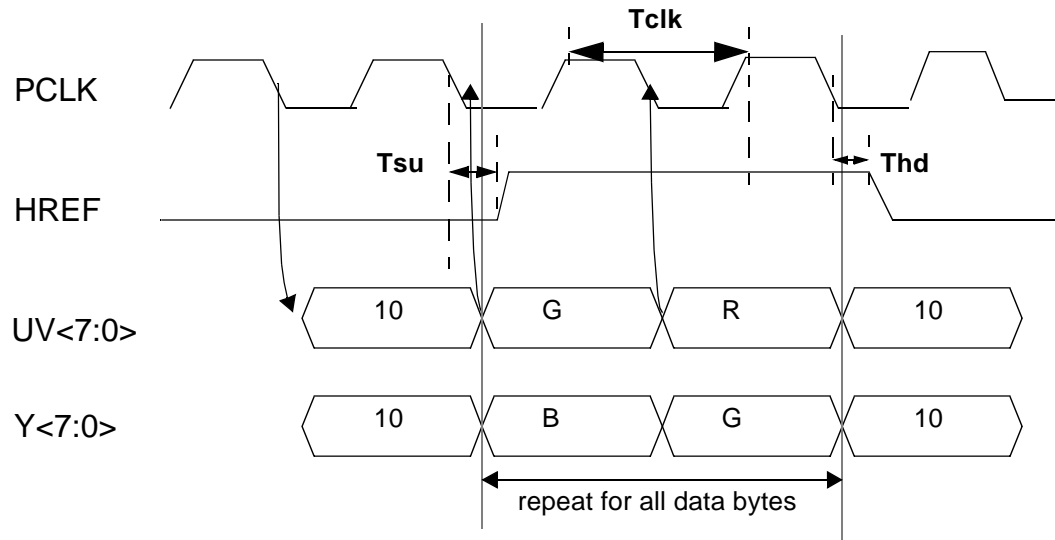

1.5.3.6 ODD FIELD: 1st HREF Y channel output $B_{11} G_{21} R_{22} G_{12} \dots$ 2nd HREF Y channel output $B_{31} G_{41} R_{42} G_{32} \dots$, so on. PCLK timing is double and use PCLK rising edge latch data bus. UV channel tri-state.

1.5.3.7 EVEN FIELD: 1st HREF Y channel output $B_{31} G_{21} R_{22} G_{32} \dots$ 2nd HREF Y channel output $B_{51} G_{41} R_{42} G_{52} \dots$, so on. PCLK timing is double and data bus should be latched by its rising edge. UV channel tri-state.

1.5.4 Progressive Scan Mode 8 Bit (484 HREF)

1.5.4.8 1st HREF Y channel output unstable data. 2nd HREF Y channel output $B_{11} G_{21} R_{22} G_{12} \dots$ 2nd HREF Y channel output $B_{31} G_{21} R_{22} G_{32} \dots$, so on. PCLK timing is double and PCLK rising edge latch data bus. UV channel tri-state. Every line data output twice.

RGB raw data timing chart is as follows:

Pixel Data 16 bit Timing
PCLK rising edge latch data bus

Pixel Data 8 bit Timing
PCLK rising edge latch data bus

FIG 1.3 Pixel Data Bus (RGB Output)

Note: **Tclk** is pixel clock period. When OV7620 system clock is 27MHz, Tclk=74ns for 16 Bit output; Tclk=37ns for 8 Bit output. **Tsu** is HREF set-up time, maximum is 15 ns; **Thd** is HREF hold time, maximum is 15 ns.

1.6 ZV Port Interlace Timing

The ZV Port is a single-source uni-directional video bus between a PC Card socket and a VGA controller. The ZV Port complies with CCIR601 timing to allow NTSC decoders to deliver real-time digital video straight into the VGA frame buffer from a PC Card. OV7620 support ZV Port Timing, which output signal can be output to a PC Card directly, then to VGA controller. The timing is as below:

FIG 1.4 ZV Port Timing

Notes: ZV Port format output signal include:

VSYNC: Vertical sync pulse.

HREF: Horizontal valid data output window.

PCLK: Pixel clock used to clock valid data and CHSYNC into ZV Port. Default frequency is 13.5MHz when use 27MHz as system clock. Rising edge of PCLK is used to clock the 16 Bit data.

Y<7:0>: 8 Bit luminance data bus..

UV<7:0>: 8 Bit chrominance data bus.

All Timing Parameters is list in following table.'

Table 1.4: ZV Port AC Parameter

| Symbol | Parameter | Min. | Max. |
|--------|-------------------------------|-------|------|
| t1 | PCLK fall timing | 4 ns | 8 ns |
| t2 | PCLK low time | 30 ns | |
| t3 | PCLK rise time | 4 ns | 8 ns |
| t4 | PCLK high time | 30 ns | |
| t5 | PCLK period | 74 ns | |
| t6 | Y/UV/HREF setup time | 10 ns | |
| t7 | Y/UV/HREF hold time | 20 ns | |
| t8 | VSYNC setup/hold time to HREF | 1 us | |

Note: In Interlaced Mode, there are Even/Odd field different (t8). When In Progressive Scan Mode, only frame timing same as Even field(t8).

After **VSYNC** falling edge, OV7620 will output black reference level, the line number is **Tvs**, which is the line number between the 1st **HREF** rising edge after **VSYNC** falling edge and 1st valid data **CHSYNC** rising edge. Then valid data, then black reference, line number is **Tve**, which is the line number between last valid data **CHSYNC** rising edge and 1st **CHSYNC** rising edge after **VSYNC** rising edge. The black reference output line number is dependent on vertical window setting.

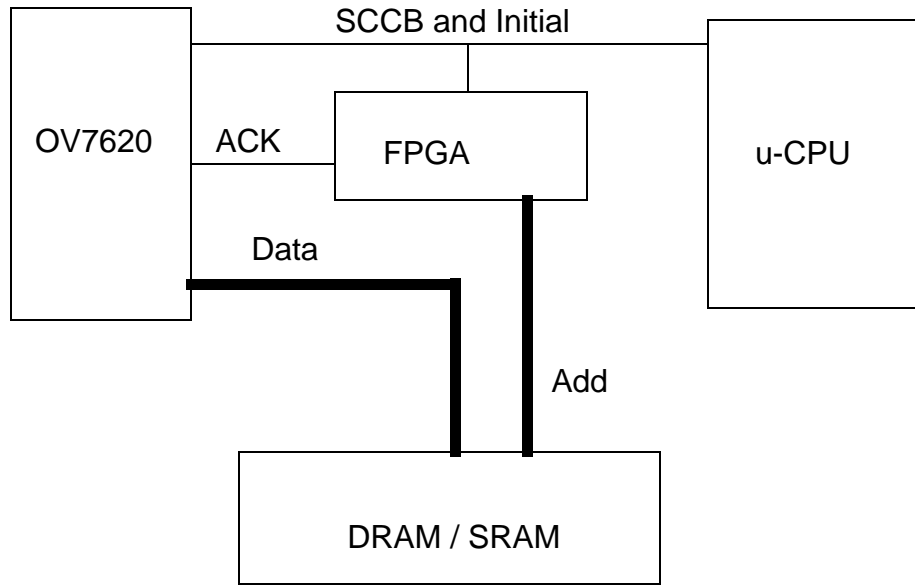

When in default setting, **Tvs** = 14***Tline**, which is changed with register register 19<7:0>. If in **Interlaced Mode**, register 19<7:0> change 1 step, **Tvs** increase 1 line. If in **Progressive Scan Mode**, register 19<7:0> step equal to 2 line.

When in default setting, **Tve** = 4***Tline** for **Odd Field**, **Tve** = 3***Tline** for **Even Field**, which is changed with register register 1A<7:0>. If in **Interlaced Mode**, register 1A<7:0> change 1 step, **Tve** increase 1 line. If in **Progressive Scan Mode**, register 1A<7:0> step equal to 2 line.

In **Progressive Scan Mode**, **Tve** = 3***Tline** and **Tvs** = 35***Tline**.

1.7 Interface for External RAM Controller and Micro-controller

OV7620 can be programmed to output single frame data to external RAM. The structure block diagram is as follows:

The timing diagram is as follows:

SRAM is internal control bit which is high means the OV7620 enter external RAM status. This is programmed by SCCB (register **27**) or power-on read-in. When **SRAM**=1, OV7620 all data bus will be tri-stated and ready to send the data. Micro-controller will send a initial signal to FPGA to reset all RAM Address block, after that, there are two method to get one frame data frame OV7620:

1. Micro-controller send a initial pulse to OV7620 **AGCEN** input pin
2. Micro-controller send a SCCB command to program OV7620 send Single frame data

The OV7620 output signal **VS** is the ACK signal from sensor, when **VS** is high means OV7620 is in ready status, when **VS** is low, means OV7620 will send one frame data.

1.8 Digital Output Format Table

Table 1.5: Digital Output Format Type

| | | Interlaced | | Progressive Scan | |
|---------------------------|----------------------|------------|---------|------------------|---------|
| Resolution | | 640x480 | 320x240 | 640x480 | 320x240 |
| YUV 4:2:2 | 16Bit | Y | Y | Y | Y |
| | 8Bit | Y | Y | Y | Y |
| | CCIR656 | Y | Y | Y | Y |
| RGB | 16Bit | Y | Y | Y | Y |
| | 8Bit | Y | Y | Y | Y |
| | CCIR656 ¹ | Y | Y | Y | Y |
| Y/UV swap ² | 16Bit | - | - | - | - |
| | 8Bit | Y | Y | Y | Y |
| U/V swap | YUV ³ | Y | Y | Y | Y |
| | RGB ⁴ | Y | Y | Y | Y |
| YG | 16Bit | Y | Y | Y | Y |
| | 8Bit | - | - | - | - |
| One Line | 16Bit | - | - | Y | - |
| | 8Bit | - | - | - | - |
| MSB/LSB swap ⁵ | | Y | Y | Y | Y |

Note: "Y" in the table means this combination is supported by OV7620.

1. RGB CCIR656 format means 4-byte SAV and EAV is inserted at the beginning and ending of HREF, which are used to grab Vsync and Hsync information. So only use 8-bit data bus line and don't need **VSYNC** and **CHSYNC** signal line.

2. Y/UV swap is valid only in 8 bit output. Y channel output sequence is Y U Y V ... rather U Y V Y

3. To YUV format, U/V swap means UV channel output sequence swap. V U V U ... rather U V U V ... for 16 bit; V Y U Y ... rather U Y V Y ... for 8-bit.

4. To RGB format, U/V swap means neighbor row B R output sequence swap. So refer to preview RGB raw data output format, different format change accordingly.

5. MSB/LSB swap means: Default Y/UV channel output port relationship is:

Table 1.6: Default Output Sequence

| | MSB | | | | | | | LSB |
|----------------------|-----|----|----|----|----|----|----|-----|
| Output Port | Y7 | Y6 | Y5 | Y4 | Y3 | Y2 | Y1 | Y0 |
| Internal Output data | Y7 | Y6 | Y5 | Y4 | Y3 | Y2 | Y1 | Y0 |

If swap, sequence is change to:

Table 1.7: Swap MSB/LSB output sequence

| | MSB | | | | | | | LSB |
|----------------------|-----|----|----|----|----|----|----|-----|
| Output Port | Y7 | Y6 | Y5 | Y4 | Y3 | Y2 | Y1 | Y0 |
| Internal Output data | Y0 | Y1 | Y2 | Y3 | Y4 | Y5 | Y6 | Y7 |

6. RGB mode selected by COMA3=1; COMA3=0 select YUV mode.
7. 8 Bit mode selected by COMB5=1.
8. CCIR656 mode selected by COMB4=1.
9. Y/UV swap selected by COMA4=1.
10. YG mode selected by COMH2=1.
11. One line mode selected by COMH7=1.
12. U/V swap mode selected by COMD0=1.
13. MSB/LSB swap mode selected by COMF2=1.

1.9 QVGA Resolution Digital Output Format

Table 1.8: QVGA Digital Output Format(YUV, beginning of line)

| Pixel # | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Y | Y0 | Y1 | Y2 | Y3 | Y4 | Y5 | Y6 | Y7 |
| UV | U0,V0 | U1,V1 | U2,V2 | U3,V3 | U4,V4 | U5,V5 | U6,V6 | U7,V7 |

1.9.5 Interlaced Mode:

Y channel output Y2 Y3 Y6 Y7 Y10 Y11 ... UV channel output U2 V3 U6 V7 U10 V11 ... Every line output data number is half(320 pixels) and all line data(240 line) in one field will be output.

1.9.6 Progressive Scan Mode:

Y channel output Y2 Y3 Y6 Y7 Y10 Y11 ... UV channel output U2 V3 U6 V7 U10 V11 ... Every line output data number is half(320 pixels) and only one half line data (every other line, total 240 line) in one frame will be output.

1.9.7 QVGA 60 Frame/s Mode:

In Interlace Mode, QVGA mode output frame rate is 30 Frame/s and 60 Field/s. When in 60 Frame/s mode, only Odd field data output and frame rate is 60 Frame/s.

Table 1.9: QVGA Digital Output Format (RGB Raw data, beginning of line)

| Pixel # | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
|---------|----|----|----|----|----|----|----|----|
| Line 1 | B0 | G1 | B2 | G3 | B4 | G5 | B6 | G7 |
| Line 2 | G0 | R1 | G2 | R3 | G4 | R5 | G6 | R7 |

1.9.8 Interlaced Mode (Default RGB two line output mode):

UV channel output G0 R1 G4 R5 G8 R9 ... Y channel output B0 G1 B4 G5 B8 G9 ...Every line output half data(320 pixels) and all line data(240 line) in one field will be output.

1.9.9 Interlaced Mode (YG two line output mode):

Y channel output G0 G1 G4 G5 G8 G9 ... UV channel output B0 R1 B4 R5 B8 R9 ... Every line output half data(320 pixels) and all line data(240 line) in one field will be output.

1.9.10 Progressive Scan Mode (Default RGB two line output mode):

UV channel output G0 R1 G4 R5 G8 R9 ... Y channel output B0 G1 B4 G5 B8 G9 ...Every line output half data(320 pixels) and all line(480 line) data in one frame will be output.

1.9.11 Progressive Scan Mode (YG two line output mode):

UV channel output G0 R1 G4 R5 G8 R9 ... Y channel output B0 G1 B4 G5 B8 G9 ...Every line output half data(320 pixels) and all line(480 line) data in one frame will be output.

1.10 Slave Mode Operation

OV7620 can be programmable to be slave device. Default OV7620 is a master device, it provide Hsync, Vsync output. If used as slave device, (register 29 bit 6=1), external master device must provide:

- System clock CLK to **XCLK1** pin;
- Horizontal sync Hsync to **CHSYNC** pin, positive acted.
- Vertical frame sync Vsync to **VSYNC** pin, positive acted.

When in slave mode, OV7620 tri-state **CHSYNC** and **VSYNC** output pin and use as input pin. To synchronize the chip, OV7620 use external system clock CLK synchronize external horizontal sync Hsync, then use synchronized horizontal sync to synchronize external vertical frame sync Vsync. But to match internal counter, these three must keep exact relation as below:

- Hsync period is $2*858 * CLK$
- Vsync period is $525* 2*858 * CLK$

Note: (1) $T_{hs} > 6*T_{clk}$ (2) $T_{hs} < T_{vs} < 2*858*T_{clk}$

FIG 1.5 Slave Mode External Sync Timing

OV7620 will be stable after 1 frame. (2nd Vsync).

1.11 Frame Exposure Mode

OV7620 support frame exposure mode when in Progressive Scan Mode. When the **FREX** pin is used as an external master device sets the exposure time. When **FREX** =1, the whole array is precharged. The exposure time is then determined by the external master device which controls **FREX**. When **FREX**=0, the OV7620 begins to output data line by line. While data is output, the OV7620 must be blocked from light by using a mechanical shutter, so that the whole array is exposed at the same time and has the same exposure period. In default line exposure mode, the array precharge and read mode is first charge 1st line, after one line read out, precharge 2nd line, so on. the width of **FREX**=1 must large the a fixed timing to make sure whole array has been precharged.

Frame exposure mode timing is as below:

FIG 1.6 Frame Exposure Timing

Note: $T_{pr} = 492 * 4 * P_{clk}$, P_{clk} is internal pixel clock. For default 27MHz, $T_{clk}=74$ ns. If $CLK<5:0>$ set to divided number, T_{clk} will increase accordingly.

T_{ex} is array exposure time which is decided by external master device.

T_{in} is undetermined due to the use of **HSYNC** rising edge to synchronize **FREX**, $T_{in} < T_{thd}$

When **FREX**=0, there are 8 lines of data output before valid data output. $T_{thd} = 4 * T_{ths}$. Valid data is output when **HREF**=1.

$T_{set} = T_{in} + T_{pr} + T_{ex}$. $T_{set} > T_{pr} + T_{in}$. Because T_{in} is uncertain, so exposure time setting resolution is T_{ths} (one line).

1.12 SCCB BUS

SCCB access is enabled only if pin **SBB**=0. OV7620 is a slave device that supports 400kbit/s 7bit address data transfer protocol. Within each byte, MSB is always transferred first, read/write control bit is the LSB of the first byte

The protocol requires **SIO-0** must be stable during the HIGH period of the **SIO-1**. Each data bit can only change state when is **SIO-1** LOW.

OV7620 reserves **CS(2:0)** for the slave ID, which makes eight slave camera combinations.

OV7620 SCCB supports multi-byte write and multi-byte read. In a write cycle, the master must supply the subaddress, however, the master does not supply the subaddress in the read cycle, therefore, OV7620 takes the read subaddress from the previous write cycle. In multi-byte write or multi-byte read cycles, the subaddress is auto increment after the first data byte so that continuous locations can be accessed in one bus cycle. Since a multi-byte cycle overwrites its original subaddress, if a read cycle follows immediately to a multi-byte cycle, it is necessary to insert a single byte write cycle that provides a new subaddress.

If OV7620 support 400 kBit/s fast SCCB mode, system clock (CLK) must be at least 10 Mhz.

1.13 SCCB REGISTER SETS

OV7620 can be configured, by setting pin CS<2:0> high or low at reset/power up, to one of eight slave IDs as listed below, the ID can not be altered once the chip is out of reset or power up state.

Table 1.10: Slave ID

| CS<2:0> | 000 | 001 | 010 | 011 | 100 | 101 | 110 | 111 |
|----------------------|------------|------------|------------|------------|------------|------------|------------|------------|
| WRITE ID (hex) | 42 | 46 | 4a | 4e | 52 | 56 | 5a | 5e |
| READ ID (hex) | 43 | 47 | 4b | 4f | 53 | 57 | 5b | 5f |

OV7620 support two option: **single** chip and **multiple** chip decided by PIN **MID**. If **MID** set to **LOW** (Default value), chip slave ID is **42**(for write) and **43**(for read). If **MID** set to **HIGH**, OV7620 can support 8 slave ID selection. Default **MID** is **LOW** by internal setting.

In write cycle, the second byte in SCCB bus is the subaddress for selecting the individual on chip registers, the third byte is the data associated with this register. Writing to unimplemented subaddress and reserved subaddress is ignored.

In read cycle, the second byte is the data associated with the previous stored subaddress. reading of unimplemented subaddress returns unknown.

Registers [00] ~ [02] contains image effect parameters that also can be modified by internal controls in auto adjust mode. This provides a simple way to read out those parameters computed by chip internal controls. To do this, first set the chip in auto adjust mode (Register 13 bit 0=1, register 12 bit 2 = 1, register 12 bit 5=1), wait for the image is stable, the register [00],[01] and [02] will be updated by internal control circuit. Then returns it to manual adjust mode(register 13 bit 0=0), all the registers retain the last adjusted values and can be read or overwritten by external host. When the chip is operated in auto adjust mode(register 13 bit 0=1), register [00] ~ [02] will be update by internal algorithm and if write data to them, there will be no effect on chip parameters. The register data can be read out.

The detailed definitions of each register are described below.

Register 00 - rw: AGC gain control

| Bits | Null | AGC6 | AGC5 | AGC4 | AGC3 | AGC2 | AGC1 | AGC0 |
|---------|------|------|------|------|------|------|------|------|
| Default | - | - | 0 | 0 | 0 | 0 | 0 | 0 |

AGC<5:0> - gain setting for the entire image channel.

The formula is:

Gain = (AGC<3:0>/16+1)*(AGC<4>+1)*(AGC<5>+1); range (1x ~ 7.75x), AGC<5> and AGC<4> control SA2.

Register 01 - rw: Blue gain control

| Bits | BLU7 | BLU6 | BLU5 | BLU4 | BLU3 | BLU2 | BLU1 | BLU0 |
|---------|------|------|------|------|------|------|------|------|
| Default | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

BLU<6:0> - white balance value for the blue channel.

The formula is:

Blue_gain=1+(BLU<7:0> - [80])/[100]; range (0.5x ~ 1.5x).

BLU<7> - Sign bit. If "1", Blue gain increase; "0" gain decrease.

Register 02 - rw: Red gain control

| Bits | RED7 | RED6 | RED5 | RED4 | RED3 | RED2 | RED1 | RED0 |
|---------|------|------|------|------|------|------|------|------|
| Default | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

RED<6:0> - white balance value for the red channel.

The formula is:

Red_gain=1+(RED<7:0> - [80])/[100]; range (0.5x ~ 1.5x).

RED<7> - Sign bit. If "1", Red channel gain increase; "0" gain decrease.

Register 03 - rw: Saturation control

| Bits | SAT7 | SAT6 | SAT5 | SAT4 | SAT3 | SAT2 | SAT1 | SAT0 |
|---------|------|------|------|------|------|------|------|------|
| Default | 1 | 0 | -0 | 0 | 0 | 0 | 0 | 0 |

SAT<7:0> - saturation adjustment for the UV channel based on the default setting; range (-4dB ~ +6dB). If SAT<7:0> > [80], increase; if SAT<7:0> < [80], decrease.

Register 04 & 05 - w: Reserved Register

This register is reserved for internal test use. Write data to this register will be no function.

Register 06 - rw: Brightness control

| Bits | BRT7 | BRT6 | BRT5 | BRT4 | BRT3 | BRT2 | BRT1 | BRT0 |
|---------|------|------|------|------|------|------|------|------|
| Default | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

BRT<7:0> - brightness adjustment for the Y/RGB channel based on the default setting; range (-200mv ~ +200mv). If BRT<7:0> > [80], brightness increase; If BRT<7:0> < [80], brightness decrease. This register is auto/manual controllable. If register 2D bit 4=1, this register is controlled by chip automatically, if write value to this register, this value will be updated by internal circuit. Only when register 2D bit 4=0, this register can be set to any value

Register 07 - rw: Analog Sharpness control

| Bits | SHP7 | SHP6 | SHP5 | SHP4 | SHP3 | SHP2 | SHP1 | SHP0 |
|---------|------|------|------|------|------|------|------|------|
| Default | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 |

SHP<7:4> - Sharpness Threshold.

SHP<3:0> - Sharpness Magnitude.

Register [08] ~ [0B] - w: Reserved.

These four registers are reserved for internal use. Write data to these registers will not function.

Register 0C - rw: White Balance background control -- Blue channel

| Bits | Null | Null | ABLU5 | ABLU4 | ABLU3 | ABLU2 | ABLU1 | ABLU0 |
|---------|------|------|-------|-------|-------|-------|-------|-------|
| Default | - | - | 1 | 0 | 0 | 0 | 0 | 0 |

Changes AWB Hue Control

ABLU<4:0> - White Balance background blue color component ratio adjustment. Adjust resolution is 0.625% and total range is (+20% - -20%) This register is used to offset image background blue component ratio.

ABLU<5> - Sign bit. If "1", decrease background blue component ratio; "0" increase blue component ratio.

Register 0D - rw: White Balance background control -- Red channel

| Bits | Null | Null | ARED5 | ARED4 | ARED3 | ARED2 | ARED1 | ARED0 |
|---------|------|------|-------|-------|-------|-------|-------|-------|
| Default | - | - | 1 | 0 | 0 | 0 | 0 | 0 |

Changes AWB Hue Control

ARED<4:0> - White Balance background red color component ratio adjustment. Adjust resolution is 1.5% and total range is (+20% - -20%) This register is used to offset image background red component ratio.

ARED<5> - Sign bit. If "1", decrease background red component ratio; "0" increase red component ratio.

Register 0E ~ 0F- rw: Reserved

These two registers are reserved for internal use. Write data to these registers will not function.

Register 10 - rw: Auto-Exposure-Control Register

| Bits | AEC7 | AEC6 | AEC5 | AEC4 | AEC3 | AEC2 | AEC1 | AEC0 |
|------------------|------|------|------|------|------|------|------|------|
| Interlace | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Progressive Scan | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

AEC<7:0> - exposure time setting; the formula is

Interlaced: $T_{EXPOSURE} = T_{LINE} \times AEC(7:0)$;

Progressive: $T_{EXPOSURE} = T_{LINE} \times AEC(7:0) \times 2$;

where $T_{LINE} = \text{Frame Time} / 525$

if use 27MHz, $T_{LINE} = 63.5 \mu\text{S}$

Range is: [00] - [7F] for Interlaced; [00] - [FF] for Progressive Scan.

* This register setting is only effective when operated in manual adjust mode (register 13 bit 0=0). Nevertheless, this register is always accessible through the SCCB bus. If register 13 bit 0=1, this register will be updated by internal circuit according AEC algorithm, and if write special value to this register will be useless. The register value can be read out at any time and latest AEC value will be return. If register 13 bit 0=0, or register 29 bit 7=1, the register will hold last value unchanged (either input from SCCB or AEC algorithm result).

* It generally takes no more than two fields for the image to reach the intended exposure after changing the setting.

Register 11 - rw: Clock rate control

| Bits | SYN7 | SYN6 | CLK5 | CLK4 | CLK3 | CLK2 | CLK1 | CLK0 |
|---------|------|------|------|------|------|------|------|------|
| Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

CLK<5:0> - system clock prescaler; this register defines the chip pixel clock rate, clock rate is defined by following fulmar:

(16 Bit mode) $PCLK = (\text{CLK_input} / ((\text{CLK}<5:0> + 1) * 2))$

(8 Bit mode) $PCLK = (\text{CLK_input} / (\text{CLK}<5:0> + 1))$

SYN<7:6> - Three sync output polarity selection:

SYN7 = 0, SYN6 = 0: HSYNC negative, CHSYNC negative, VSYNC positive edge;

SYN7 = 0, SYN6 = 1: HSYNC negative, CHSYNC negative, VSYNC negative;

SYN7 = 1, SYN6 = 0: HSYNC positive, CHSYNC negative, VSYNC positive.

SYN7 = 1, SYN6 = 1: HSYNC negative, CHSYNC positive, VSYNC positive.

* The effect of the change is immediate, however, it generally takes about two fields for the image to reach the stable state

Register 12 - rw: Common control A

| Bits | COMA7 | COMA6 | COMA5 | COMA4 | COMA3 | COMA2 | COMA1 | COMA0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 |

COMA7 - "1" initiates the chip soft reset, the reset takes place after the acknowledge bit is issued, the effect is the same as power up the chip, the chip is initialized to a default state, all registers including SCCB's contents are set to default, this bit is self cleared after the reset.

COMA6 - "1" selects mirror image

COMA5 - "1" enables AGC. "0" - stop AGC and set register [00] to default value. Only effective in auto adjust mode.

COMA4 - "1" select 8 Bit Digital output format is Y U Y V Y U Y V ...

COMA3 - "1" selects raw data signal as video data output, "0" selects YCrCb as video data output. The selection applies to both analog video and digital video.

COMA2 - "1" enable auto white balance, "0" AWB stop and AWB register [01] and [02] value is held at last updated value. Can used as one-shot AWB mode. Valid only in auto mode.

COMA1 - "1" selects Color Bar Test pattern output.

COMA0 - "1" select precise A/D Black Level Compensation (BLC) line method. "0" use standard black level compensation to do A/D BLC field method which is more stable but less precise.

Register 13 - rw: Common control B

| Bits | COMB7 | COMB6 | COMB5 | COMB4 | COMB3 | COMB2 | COMB1 | COMB0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | - | - | 0 | 0 | 0 | 0 | 0 | 1 |

COMB7 - Reserved.

COMB6 - Reserved.

COMB5 - "1" selects 8 bit data format, Y/CrCb and RGB video data is multiplexed to the eight bit **Y** bus, tri-state **UV** bus; "0" selects 16 bit format, data go to both **Y<7:0>** bus and **UV<7:0>** bus.

COMB4 - "0" enables digital output in CCIR601 format. "1" enables CCIR656 format.

COMB3 - "0" selects horizontal sync for output to pin **CHSYNC**, "1" selects composite sync for output.

COMB2 - "1" tri-states bus **Y<7:0>** and **UV<7:0>**, "0" enables both buses.

COMB1 - "1" initiates the single frame transfer, for this function to work, field drop mode (FD<1:0> in register [16]) must set to "OFF". See figure below. After this bit is set, for Interlaced mode, **HREF** is only asserted for consecutive two fields beginning at Odd field. This bit is cleared automatically at the end of this frame. For Progressive Scan mode, **HREF** is only asserted for one frame. Clearing this bit in the middle of active frame has no effect to the assertion of current **HREF**.

COMB0 - "1" enables auto adjust mode, in this mode, internal exposure circuitry overwrites those parameters in registers [00]-[02], the chip adjusts the image based on a preset algorithm. "0" manual adjust mode.

FIG 1.7 Single Frame Transfer Example (Interlaced Mode)

FIG 1.8 Single Frame Transfer Example (Progressive Scan Mode)

Register 14- rw: Common control C

| Bits | COMC7 | COMC6 | COMC5 | COMC4 | COMC3 | COMC2 | COMC1 | COMC0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | - | 0 | 0 | 0 | 1 | - | - |

COMC7 - AWB activation threshold selection: 1- high; 0-low.

COMC6 - Reserved.

COMC5 - QVGA digital output format selection. 1 - 320x240; 0 - 640x480.

COMC4 - Field/Frame vertical sync output in VSYNC port selection: 1 - frame sync, only inserted in ODD field vertical sync; 0 - field vertical sync, effect in Interlaced mode

COMC3 - HREF polarity selection: 0 - HREF positive effective, 1 - HREF negative.

COMC2 - RGB gamma selection: 1 - Gamma on, value defined by register [62] value; 0 - gamma is 1 (linear).

COMC1 - Reserved.

COMC0 - Reserved.

Register 15- rw: Common control D

| Bits | COMD7 | COMD6 | COMD5 | COMD4 | COMD3 | COMD2 | COMD1 | COMD0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | - | 0 | - | - | - | - | - | 1 |

COMD7 - Reserved.

COMD6 - PCLK polarity selection. "0" OV7620 output data at PCLK falling edge and data bus will be stable at PCLK rising edge; "1" rising edge output data and stable at PCLK falling edge. When OV7620 work as CCIR656 format, COMB4=1, this bit is disable and should use PCLK rising edge latch data bus.

COMD<5:1> - Reserved.

COMD0 - U V digital output sequence exchange control. 0 - V U V U ... for 16Bit, V Y U Y ... for 8 Bit; 1- U V U V ... for 16Bit and U Y V Y ... for 8 Bit.

Register 16 - rw: Frame Drop

| Bits | FD7 | FD6 | FD5 | FD4 | FD3 | FD2 | FD1 | FD0 |
|---------|-----|-----|-----|-----|-----|-----|-----|-----|
| Default | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |

FD<7:2>- Frame drop selection, it operates in ODD and EVEN mode as defined by FD<1:0>, it is ignored in OFF & FRAME mode. Its purpose is to divide the video signal into programmed number of time slots in unit of field/frame, and to allow HREF to be active only one field/frame during the period. This function does not affect the video data or pixel rate.

000000 - 000001: disable digital data output, only output black reference level.

000010 - 111111: Output 1 of (2 ~ 63) frame. If set register 33 bit 1= 1, that means only drop 1 frame from (2 ~ 63) frame.

Interlaced:

- FD<1:0>- field mode selection. Each frame consists of two fields: Odd & Even, these bits defines the assertion of HREF in relation to the two fields.
- 00 - OFF mode; HREF is not asserted in both fields, one exception is the single frame transfer operation (see the description for the register [13])
 - 01 - ODD mode; HREF is asserted in odd field only.
 - 10 - EVEN mode; HREF is asserted in even field only.
 - 11 - FRAME mode; HREF is asserted in both odd field and even field. FD<7:2> useless (default).

Progressive Scan:

- FD<1:0> - frame mode selection.
- 00 - OFF mode; HREF is not asserted in both fields, one exception is the single frame transfer operation (see the description for the register [13])
 - 01,10 - SLOT mode; HREF is asserted in frame according FD<7:2>.
 - 11 - FRAME mode; HREF is asserted in every frame. FD<7:2> useless

Register 17 - rw: Horizontal Window start

| Bits | HS7 | HS6 | HS5 | HS4 | HS3 | HS2 | HS1 | HS0 |
|---------|-----|-----|-----|-----|-----|-----|-----|-----|
| Default | 0 | 0 | 1 | 0 | 1 | 1 | 1 | 1 |

HS<7:0> - selects the starting point of HREF window, each LSB represents four pixels for Interlaced/Progressive full resolution mode, two pixels for QVGA resolution mode, this value is set based on an internal column counter, the default value corresponds to 640 horizontal window. Maximum window size is 664. see window description below. HS<7:0> programmable range is [2C]- [D2], and should less than HE<7:0>. HS<7:0> should be programmable to value larger than or equal to [2C]. Value larger than [D2] is invalid. See Figure 1.14.

Register 18 - rw: Horizontal Window end

| Bits | HE7 | HE6 | HE5 | HE4 | HE3 | HE2 | HE1 | HE0 |
|---------|-----|-----|-----|-----|-----|-----|-----|-----|
| Default | 1 | 1 | 0 | 0 | 1 | 1 | 1 | 1 |

HE<7:0> - selects the ending point of HREF window, each LSB represents four pixels for full resolution and two pixels for QVGA resolution, this value is set based on an internal column counter, the default value corresponds to the last available pixel. The HE<7:0> programmable range is [2D] - [D2]. HE<7:0> should be larger than HS<7:0> and less than or equal to [D2]. Value larger than [D2] is invalid. See Figure 1.14.

Register 19- rw: Vertical Window start

| Bits | VS7 | VS6 | VS5 | VS4 | VS3 | VS2 | VS1 | VS0 |
|---------|-----|-----|-----|-----|-----|-----|-----|-----|
| Default | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |

VS<7:0> - selects the starting row of vertical window, in full resolution mode, each LSB represents 1scan line in one field for Interlaced Mode, 2 scan line in one frame for Progressive Scan Mode. In QVGA resolution (set by register 14 bit 5), each LSB represents 1 scan line in one field for Interlaced Mode, 1scan line in one frame for Progressive Scan Mode. See Figure 1.14. Min. is [05], max. is [F6] and should less than VE<7:0>.

Register 1A- rw: Vertical Window end

| Bits | VE7 | VE6 | VE5 | VE4 | VE3 | VE2 | VE1 | VE0 |
|---------|-----|-----|-----|-----|-----|-----|-----|-----|
| Default | 1 | 1 | 1 | 1 | 0 | 1 | 0 | 1 |

VE<7:0>- selects the ending row of vertical window, in full resolution mode, each LSB represents 1scan line in one field for Interlaced Mode, 2 scan line in one frame for Progressive Scan Mode. In QVGA resolution, each LSB represents 1 scan line in one field for Interlaced Mode, 1scan line in one frame for Progressive Scan Mode. See Figure 1.14. Min. is [05], max. is [F6] and should larger than VS<7:0>.

As shown above, HS<7:0> defines the starting pixel within a scan line, HE<7:0> defines the ending pixel within a scan line. VS<7:0> defines the starting row within a field, VE<7:0> defines the ending row within a field. VS/VE automatically defines the window height of a image frame. The rectangular window defined by HS/HE/VS/VE is the active image window. Only pixels inside this window is valid, along with the HREF timing signals, black level substitutes the pixel data when outside the active window.

Identical value for HS/HE or VS/VE is not permitted since it causes undefined window size.

If end point is lower than the starting point, the window begins from the starting point and ends at the far end of the available image boundary.

The window size calculate formula is as below:

1. Horizontal size: VGA mode: Horizontal window size = (Register [18] - Register [17])*4.
QVGA mode: Horizontal window size = (Register [18] - Register [17])*2.
2. Vertical size: VGA mode: Vertical window size = (Register [1A]- Register [19]+1);
QVGA mode: Horizontal window size = (Register [1A] - Register [19]+ 1).

Register 1B- rw: Pixel shift

| Bits | PS7 | PS6 | PS5 | PS4 | PS3 | PS2 | PS1 | PS0 |
|---------|-----|-----|-----|-----|-----|-----|-----|-----|
| Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

PS<7:0> - to provide a way to fine tune the output timing of the pixel data relative to that of **HREF**, it physically shifts the video data output time early or late in unit of pixel clock as shown in the figure below. This function is different from changing the size of the window as is defined by HS<7:0> & HE<7:0> in register [17] and [18].

The number of pixels that can only be shifted late. Maximum shift pixel number is 255.

Register 1C- r: Manufacture ID high byte

| Bits | MIDH7 | MIDH6 | MIDH5 | MIDH4 | MIDH3 | MIDH2 | MIDH1 | MIDH0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

MIDH<7:0> - read only, always returns "7F".

Register 1D- r: Manufacture ID low byte

| Bits | MIDL7 | MIDL6 | MIDL5 | MIDL4 | MIDL3 | MIDL2 | MIDL1 | MIDL0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 0 |

MIDL<7:0>- read only, always returns "A2"

Register 1E ~ 1F- rw: Reserved

These two registers are reserved for internal use. Write data to these registers will not function.

Register 20- rw: Common control E

| Bits | COME7 | COME6 | COME5 | COME4 | COME3 | COME2 | COME1 | COME0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 0 | 0 | 0 | 0 | - | 0 | 0 |

COME7 - Modified CCIR656 format vertical sizing enabled. "1" will enable vertical windowing function. "0" will limit vertical size to 480 lines - unchanged by [19] and [1B].

COME6 - Field luminance average signal generation enable. Value is stored in register [7C]

COME5 - "1" First stage aperture correction enable. Correction strength will be decided by register [07]. "0" disable first stage aperture correction.

COME4 - "1" Second stage aperture correction enable. Correction strength and threshold value will be decided by register 26 bit 7 ~ register 26 bit 4.

COME3 - AWB smart mode enable. 1 - Drop out pixel when compare pixel red, blue and green component level to change register [01] and [02], which luminance level is higher than presetting level and lower than presetting level, this two level is set by register [0F]. 0 - calculate all pixels to get AWB result. Valid only when register 13 bit 0=1 and register 12 bit 2=1

COME2 - Reserved.

COME1 - AWB fast/slow mode selection. "1" - AWB is always fast mode, that is register [01] and [02] is changed every field/frame. "0" AWB is slow mode, [01] and [02] change every 16/64 field/frame decided by register 70 bit 1. When AWB enable, register 12 bit 2=1, AWB is working as fast mode at first 1024 field/frame, than as slow mode later.

COME0 - Digital output driver capability increase selection: "1" Double digital output driver current; "0" low output driver current status.

Register 21- rw: Y Channel Offset Adjustment

| Bits | Y7 | Y6 | Y5 | Y4 | Y3 | Y2 | Y1 | Y0 |
|---------|----|----|----|----|----|----|----|----|
| Default | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Y6-Y0: Y channel digital output offset adjustment. Range: +127mV ~ -127mV. If COMG2=0, this register will be updated by internal auto A/D BLC circuit, and write a value to this register with SCCB has no effect. If COMG2=1, Y channel offset adjustment will use the register stored value which can be changed by SCCB. If COMF1=0, this register has no adjustment effect to A/D output data. If output RGB raw data, this register will adjust R/G/B data.

Y7: Offset adjustment direction 0 - Add Y[6:0]; 1 - Subtract Y[6:0].

Register 22- rw: U Channel Offset Adjustment

| Bits | U7 | U6 | U5 | U4 | U3 | U2 | U1 | U0 |
|---------|----|----|----|----|----|----|----|----|
| Default | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

U6-U0: U channel digital output offset adjustment. Range: +128mV ~ -128mV. If register 27 bit 2=0, this register will be updated by internal auto A/D BLC circuit, and write a value to this register with SCCB has no effect. If register 27 bit 2=1, U channel offset adjustment will use the register stored value which can be changed by SCCB. If register 26 bit 1=1, this register has no effect to A/D output data. If output RGB raw data, this register will adjust R/G/B data.

U7: Offset adjustment direction: 0 - Add U[6:0]; 1 -Subtract U[6:0].

If register 2D bit 0 = 0, this register has no function.

Register 23- rw: Crystal Current control.

| Bits | CC7 | CC6 | CC5 | CC4 | CC3 | CC2 | CC1 | CC0 |
|---------|-----|-----|-----|-----|-----|-----|-----|-----|
| Default | 0 | 0 | 0 | - | - | - | - | - |

CC7 - CC6: Crystal amplifier current gain. (00) maximum current; (11) minimum current

CC5 ~ CC0: Reserved

Register 24- rw: AEW Auto Exposure White Pixel Ratio

| Bits | AEW7 | AEW6 | AEW5 | AEW4 | AEW3 | AEW2 | AEW1 | AEW0 |
|------------------|------|------|------|------|------|------|------|------|
| Interlace | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| Progressive Scan | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |

Registers 24 and 25 together control the AEC target values for image brightness.

For a brighter image, increase register 24 and decrease register 25.

For a darker image, decrease register 24 and decrease register 25.

AEW7-AEW0 - used to calculate the white pixel ratio. OV7620 AEC algorithm counts the whole field/frame white pixel (its luminance level is higher than a fixed level) and black pixel (its luminance level is lower than a fixed level) number. When white/black pixel ratio is same as the ratio defined by registers [25] and [26], image stable. This register is used to define the white pixel ratio, default is 25%, each LSB represent step: Interlaced: 1.3%; Progressive Scan: 0.7%. Change range is: Interlaced: [01] ~ [4A]; Progressive Scan: [01] ~ [96]. Increase AEW<7:0> will increase the white pixel ratio. For same light condition, the image brightness will increase if AEW<7:0> increase.

Note: AEW<7:0> must combined with register [26] AEB<7:0>. Keep the relation always true: AEW<7:0> + AEB<7:0> > [4A] for Interlaced; AEW<7:0> + AEB<7:0> > [90].

Register 25- rw: AEC Auto Exposure Black Pixel Ratio

| Bits | AEB7 | AEB6 | AEB5 | AEB4 | AEB3 | AEB2 | AEB1 | AEB0 |
|------------------|------|------|------|------|------|------|------|------|
| Interlace | 0 | 1 | 0 | 0 | 1 | 0 | 1 | 0 |
| Progressive Scan | 1 | 0 | 0 | 0 | 1 | 0 | 1 | 0 |

AEB7-AEB0 - used to calculate the black pixel ratio. OV7620 AEC algorithm is count whole field/frame white pixel (its luminance level is higher than a fixed level) and black pixel (its luminance level is lower than a fixed level) number. When white/black pixel ratio is same as the ratio defined by registers [25] and [26], image stable. This register is used to define black pixel ratio, default is 75%, each LSB represent step: Interlaced: 1.3%; Progressive Scan: 0.7%. Change range is: Interlaced: [01] ~ [4A]; Progressive Scan: [01] ~ [96]. Increase AEB<7:0> will increase black pixel ratio. For same light condition, the image brightness will decrease if AEB<7:0> increase.

Note: AEB<7:0> must combined with register [25] AEW<7:0>. Keep the relation always true: AEW<7:0> + AEB<7:0> > [4D] for Interlaced; AEW<7:0> + AEB<7:0> > [90].

Register 26 - rw: Common control F

| Bits | COMF7 | COMF6 | COMF5 | COMF4 | COMF3 | COMF2 | COMF1 | COMF0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 0 |

COMF7 - COMF6: Digital Sharpness threshold selection.

[00] - Difference of neighbor pixel luminance is larger than 8 mV, correction on.

[01] - 16 mV.

[10] - 32 mV.

[11] - 64 mV.

COMF5 - COMF4: Digital Sharpness Magnitude selection.

[01] - Strength is 50% of difference of neighbor pixel luminance.

[10] - 100%.

[11] - 200%.

COMF3 - Reserved

COMF2 - Swap bus MSB/LSB. "1" LSB->Bit7, MSB->Bit0; "0" normal.

COMF1 - "1" A/D Black level calibration enable. Do not use "0".

COMF0 - "1" Output first 4 line black level for Interlaced Mode and 8 line black level for Progressive Scan Mode before valid data output. HREF number will increase 4/8 relatively. "0" no black level output.

Register 27 - rw: Common control G

| Bits | COMG7 | COMG6 | COMG5 | COMG4 | COMG3 | COMG2 | COMG1 | COMG0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 0 |

COMG7: Reserved.

COMG6: Reserved.

COMG5: Reserved.

COMG4: RGB matrix disable. "1" - Bypass RGB matrix. "0" - Enable RGB matrix.

COMG3: Reserved.

COMG2: "1" Enables manual adjustment of A/D offset: 1 - A/D data will add or subtract a value defined by registers [21] and [22]. 0 - A/D data will be shifted by a value defined by registers [21], [22] and [2E], which is updated by internal circuit.

COMG1: - Disables CCIR range clip.

COMG0: - Special interface for external micro-controller and RAM timing control. See timing chart.

Register 28 - rw: Common control H

| Bits | COMH7 | COMH6 | COMH5 | COMH4 | COMH3 | COMH2 | COMH1 | COMH0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

COMH7: - "1" selects One-Line RGB raw data output format, "0" selects normal dual-line (repetitive) raw data output, effective only in Progressive Scan mode.

COMH6: - "1" enable Black/White mode.

COMH5: - "1" select Progressive Scan mode; "0" select Interlaced mode.

COMH4: - Freeze AEC/AGC value - current values retained. This is effective only when register 13 bit 0=1.

COMH3: - AGC disable.

COMH2: - Raw data output format: "1" - Green on Y channel, B R B R....on UV channel (GRB422), "0" - G R G R.... on Y channel, B G B G.... on UV channel.

COMH1: - 2x Gain boost. "1" Double PreAmp gain to 6dB. "0" PreAmp gain is 0dB.

COMH0: - Reserved.

Register 29 - rw: Common control I

| Bits | COMI7 | COMI6 | COMI5 | COMI4 | COMI3 | COMI2 | COMI1 | COMI0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

COMI7: - AEC disable. "1" If register 13 bit 0=1, AEC stop and register [10] value will be held at last AEC value and not be updated by internal circuit. "0" - if register 13 bit 0=1, register [10] value will be updated by internal circuit

COMI6: - Enable slave sync mode selection. "1" slave mode, use external CHSYNC and VSYNC. "0" master mode

COMI<5:4> - Reserved.

COMI3: - Central weighted exposure control.

COMI2: - Reserved.

COMI1 - COMI0: Version flag.

Register [2A] - rw: Frame Rate Adjust Register 1

| Bits | EHS7 | EHS6 | EHS5 | EHS4 | EHS3 | EHS2 | EHS1 | EHS0 |
|---------|------|------|------|------|------|------|------|------|
| Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

EHS7 - Frame Rate adjustment enable bit. "1" Enable.

EHS<6:5> - Highest 2 bit of frame rate adjust control byte. See explanation in register [2B].

EHS4 - "1" - UV component delay 2 pixel. "0" no 2*Tp delay.

EHS3 - Y channel brightness adjustment enable. When COMF2=1 active.

EHS2 - For QVGA raw data format. "1" will force Y to output B G B G and UV to output G R G R

EHS<1:0> - Reserved.

Register [2B] - rw: Frame Rate Adjust Register 2

| Bits | EHL7 | EHL6 | EHL5 | EHL4 | EHL3 | EHL2 | EHL1 | EHL0 |
|---------|------|------|------|------|------|------|------|------|
| Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

EHL<7:0> - Lowest 8 bit of frame rate adjust control byte. Frame rate adjustment resolution is 0.12%.

Control word is 10 bit. Every count decreases frame rate by 0.12%. Range is 0.12% - 112%. If frame rate adjustment is enabled, COME7 must be set to "0".

Register [2C] - rw: Black Expanding Register

| Bits | EXBK7 | EXBK6 | EXBK5 | EXBK4 | EXBK3 | EXBK2 | EXBK1 | EXBK0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

EXBK<7:4> - Coarse Auto Black Level adjustment. Range is 0.08% - 1.3%

EXBK<3:0> - Fine Auto Black Level adjustment. Range is 0.08% - 1.3%.

Register [2D] - rw: Common Control J

| Bits | COMJ7 | COMJ6 | COMJ5 | OMJ4 | COMJ3 | COMJ2 | COMJ1 | COMJ0 |
|---------|-------|-------|-------|------|-------|-------|-------|-------|
| Default | 1 | 0 | 0 | 0 | 0 | 0 | - | 1 |

COMJ7 - Reserved. Always set to "1".

COMJ6 - QVGA 60 frame/s selection. "1" Only Odd field in Interlace Mode data output, "0" Odd/Even field data output frame rate is 30 frames/s. VGA is output at 60 frames/s in dual line mode raw data.

COMJ5 - Reserved. Always set to "0".

COMJ4 - Auto brightness enabled.

COMJ3 - Reserved. Always set to "0".

COMJ2 - Banding filter enable. After adjust frame rate to match indoor light frequency, this bit enable a different exposure algorithm to cut light band induced by fluorescent light.

COMJ1 - Reserved. Always set to "0".

COMJ0 - Reserved. Always set to "1".

Register [2E]- rw: V Channel Offset Adjustment

| Bits | V7 | V6 | V5 | V4 | V3 | V2 | V1 | V0 |
|---------|----|----|----|----|----|----|----|----|
| Default | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

V7-V0: V channel digital output offset adjustment. Range: +128mV ~ -128mV. If COMG2=0, this register will be updated by internal auto A/D BLC circuit, and write a value to this register with SCCB has no effect. If COMG2=1, V channel offset adjustment will use the register stored value which can be changed by SCCB. If COMF1=1, this register has no effect to A/D output data. If output raw data, this register will adjust R/G/B data.

V7: Offset adjustment direction: 0 - Add V[6:0]; 0-Substrate V[6:0].
If COMJ0 = 0, this register value is common to U and V channel.

Register 2F ~ 5F - w: Reserved

Address [2F] - [5F] are reserved for internal use.

Register 60- rw: Signal Process Control A

| Bits | SPCA7 | SPCA6 | SPCA5 | SPCA4 | SPCA3 | SPCA2 | SPCA1 | SPCA0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 1 |

SPCA7: 1.5x gain boost.

SPCA6: Reserved.

SPCA5: "1" disables green averaging for UV channel.

SPCA4: "1" disables green averaging for luminance channel.

SPCA<3:2> Reserved.

SPCA<1:0>: Reserved. Color set to "0111"; B&W set to "0000".

Register 61- rw: Signal Process Control B

| Bits | SPCB7 | SPCB6 | SPCB5 | SPCB4 | SPCB3 | SPCB2 | SPCB1 | SPCB0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

SPCB7: "1" YUV mode; "0" raw data mode.

SPCB6: Reserved. Always set to "0".

SPCB5: Reserved. Always set to "0".

SPCB4: Reserved. Always set to "0".

SPCB3: Reserved. Always set to "0".

SPCB2: Limits range of register [6] to half value.

SPCB<1:0>: Auto Brightness target reference level: (00) -- 0 IRE; (01) -- 6 IRE; (10) -- 10 IRE; (11) -- 20 IRE.

Register 62- rw: RGB Gamma Control

| Bits | RGM7 | RGM6 | RGM5 | RGM4 | RGM3 | RGM2 | RGM1 | RGM0 |
|---------|------|------|------|------|------|------|------|------|
| Default | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 |

RGM<7:1> raw data or UV gamma curve selection.

RGM0: Reserved. Always set to "0".

Register 63- rw: Reserved

Address [63] are reserved for internal use.

Register 64- rw: Y Gamma Control

| Bits | YGM7 | YGM6 | YGM5 | YGM4 | YGM3 | YGM2 | YGM1 | YGM0 |
|---------|------|------|------|------|------|------|------|------|
| Default | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 1 |

YGM<7:1>: Y gamma curve selection.

YGM<0>: "1" enable; "0" disable (linear).

Register 65- rw: Signal Process Control C

| Bits | SPCC7 | SPCC6 | SPCC5 | SPCC4 | SPCC3 | SPCC2 | SPCC1 | SPCC0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 |

SPCC<7:3> Reserved.

SPCC2: A/D mode selection. Increase A/D range by 1.5X

SPCC<1:0>: A/D reference selection. <00>: input signal range 0.9V; <01>: 1.0V peak
<10>: 1.15V peak; <11>: 1.26V peak. Do not use <00> selection.

Register 66- rw: AWB Process Control

| Bits | AWBC7 | AWBC6 | AWBC5 | AWBC4 | AWBC3 | AWBC2 | AWBC1 | AWBC0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |

White balance limiting function - YUV matrix control.

Register 74:7 must be enabled for AWB process control.

AWBC<7:6>: Smart AWB ignores RGB raw data pixel values above (00):70%, (01): 80%, (10): 90%, (11):100%.

AWBC<5:4>: Smart AWB ignores RGB raw data pixel values below (00):10%, (01) 20%, (10) 30%, (11) 40%.

AWBC<3:2>: U threshold level selection if use U/V as white balance feedback

00: (-10% ~ 10%); 01: (-20% ~ 20%); 10: (-30% ~ 30%); 11: (-40% ~ 40%)

AWBC<1:0>: V threshold level selection if use U/V as white balance feedback

00: (-10% ~ 10%); 01: (-20% ~ 20%); 10: (-30% ~ 30%); 11: (-40% ~ 40%)

Register 67- rw: Color Space Selection

| Bits | YUV7 | YUV6 | YUV5 | YUV4 | YUV3 | YUV2 | YUV1 | YUV0 |
|---------|------|------|------|------|------|------|------|------|
| Default | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 0 |

YUV<7:6>: UV coefficient selection (U/V is output and u/v is input)

- [00]: YUV
- [01]: Analog YUV
- [10]: CCIR 601 YCrCb
- [11]: PAL YUV

YUV5: U/V signal delay 2 pixel selection

YUV4: U/V signal with 3 point chroma average(2 pixel delay accordingly)

YUV<3:2>: Y signal delay selection: (00) - 0; (01) - 1; (10) - 2; (11) - 3 pixels

YUV1: Auto saturation control (decreases color noise) enable.

YUV0: Auto saturation control range selection: 0 - 1.5x; 1 - 1x.

Register 68- rw: Signal Process Control D

| Bits | SPCD7 | SPCD6 | SPCD5 | SPCD4 | SPCD3 | SPCD2 | SPCD1 | SPCD0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 0 |

SPCD<7:5>: AEC/AGC Brightness Target level selection.

000 - 10%; 001 - 30%; 010 - 50%; 011 - 70%; 100 - 80%; 101 - 90%; 110 - 100%; 111 - 110%.

SPCD4: Reserved. Always set to "0".

SPCD<3:2>: Anti-alias threshold: 11 lowest threshold; 01, 10 midrange threshold; 00 highest threshold.

SPCD<1:0>: Anti-alias magnitude: 00 - low strength; 01, 10 mid strength; 11:high strength.

Register 69- rw: Analog Sharpness

| Bits | EDGE7 | EDGE6 | EDGE5 | EDGE4 | EDGE3 | EDGE2 | EDGE1 | EDGE0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 0 |

EDGE<7:3> Reserved.

EDGE2: Vertical Edge Enhancement enable. Register 20:5 must be set to "1".

EDGE<1:0>: Reserved.

Register 6A- rw: Vertical Edge Enhancement Control

| Bits | VEG7 | VEG6 | VEG5 | VEG4 | VEG3 | VEG2 | VEG1 | VEG0 |
|---------|------|------|------|------|------|------|------|------|
| Default | - | 1 | 0 | 0 | 0 | 0 | 1 | 0 |

VEG<6:4>: Vertical Edge Enhancement threshold range

VEG<3:0>: Vertical Edge Enhancement magnitude value. 0000: weakest; 1111: strongest.

Register 6B-6E rw: Reserved

Address [6B] - [6E] are reserved for internal use.

Register 6F - rw: Even/Odd Noise Compensation Control

| Bits | EOC7 | EOC6 | EOC5 | EOC4 | EOC3 | EOC2 | EOC1 | EOC0 |
|---------|------|------|------|------|------|------|------|------|
| Default | - | - | 1 | 1 | 1 | 0 | 1 | 0 |

EOC<7:6>: Reserved.

EOC<5:4>: Color Kill luminance threshold selection: 00 - none; 01 - 2.6v; 10 - 2.4v; 11 - 2.3v. Lower luminance selection will activate color kill.

EOC<3:0>: Set to factory recommended values.

Register 70 - rw: Common Control K

| Bits | COMK7 | COMK6 | COMK5 | COMK4 | COMK3 | COMK2 | COMK1 | COMK0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

COMK7 - "1" HREF edges coincident (no delay) with PCLK negative/falling edges (COMD6 must be set to "0"). "0" HREF edge occurs 10 ns after PCLK positive/rising edge.

COMK6 - Output port drive current additional 2x control bit.

COMK5 - Reserved.

COMK4 - Selects ZV port timing. "1" VSYNC output ZV port vertical sync signal. "0" normal TV vertical sync signal.

COMK3 - Accelerated saturation mode for camera mode change. (QVGA, 8 Bit output, CCIR 656 mode and Progressive Scan Mode). After relative control bit set, the first VS will be the stable image with suitable AEC/AWB setting. "0" - slow mode, after mode change need more field/frame to get stable AEC/AWB setting image.

COMK2 - Reserved.

COMK1 - AWB update rate selection. "1" fast mode; "0" slow mode.

COMK0 - Set to "1" in single line mode, otherwise set to "0" and set COMG4 to disable.

Register 71 - rw: Common Control J

| Bits | COML7 | COML6 | COML5 | COML4 | COML3 | COMK2 | COML1 | COML0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

COML7 - Auto Brightness update rate: "1" - Slow mode; "0" - fast mode.

COML6 - Gated PCLK selection. "1" - Enables PCLK gated by HREF; "0" - PCLK is free running clock

COML5 - Swap HREF output pin with CHSYNC. "1" - HREF pin output CHSYNC signal; "0" - No swap.

COML4 - Swap CHSYNC output pin with HREF. "1" - CHSYNC pin output HREF signal; "0" - normal output.

COML<3:2>- Highest 2 bit for HSYNC rising edge shift control, combined with register [72]

COML<1:0>- Highest 2 bit for HSYNC falling edge shift control, combined with register [73]

Register 72- rw: Horizontal Sync 1st Edge shifting

| Bits | HSDY7 | HSDY6 | HSDy5 | HSDY4 | HSDY3 | HSDY2 | HSDY1 | HSDY0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 0 | 0 | 1 | 0 | 1 | 0 | 0 |

HSDY<7:0> - Lower 8 bit control for shifting horizontal sync CHSYNC first edge. Range is [000] - [3FF]. Every count equals 1 PCLK.

Register 73 - rw: Horizontal Sync 2nd Edge shifting

| Bits | HEDY7 | HEDY6 | HEDY5 | HEDY4 | HEDY3 | HEDY2 | HEDY1 | HEDY0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 0 |

HSDY<7:0> - Lower 8 bit control for shifting horizontal sync CHSYNC second edge. Range is [000] - [3FF].
Every count equals 1 PCLK.

Register 74 - rw: Common Control M

| Bits | COMM7 | COMM6 | COMM5 | COMM4 | COMM3 | COMM2 | COMM1 | COMM0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |

COMM7 - Enable UV Smart AWB threshold control.
COMM<6:5> - AGC maximum gain selection: 00 - 2x; 01 - 4x; 10 - 2x; 11 - 8x
COMM<4:0> - Reserved.

Register 75 - rw: Common Control N

| Bits | COMN7 | COMN6 | COMN5 | COMN4 | COMN3 | COMN2 | COMN1 | COMN0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

COMN7 - "1" enables Auto brightness range limit. Minimum will be [40]. Otherwise will be [00] ~ [FF].
COMN<6:3> - Reserved.
COMN2 - This bit further reduces the exposure time to 1/120 second or 1/100 second when the banding filter is enabled and the light is too strong.
COMN1 - If enabled, manual write white balance value, then change to auto, the stable time will be less. Speeds white balance stable time when switching from manual to AWB.
COMN0 - Enables addition of 2 pixel averaging.

Register 76 - rw: Common Control O

| Bits | COMO7 | COMO6 | COMO5 | COMO4 | COMO3 | COMO2 | COMO1 | COMO0 |
|---------|-------|-------|-------|-------|-------|-------|-------|-------|
| Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

COMO7 - Output XCLK from **FODD** pin.
COMO6 - Reserved.
COMO5 - Software power down enable: 1 - enable; 0 - wake up
COMO4 - Reserved.
COMO3 - Limits the Minimum Exposure time to 4 lines rather 1 line with AEC enable
COMO2 - Tri-state sync and CLK output, except data line
COMO<1:0> - Reserved.

Register 77-7B - rw: Reserved

Address [2F] - [5F] are reserved for internal use.

Register 7C - rw: Field Average Level Storage

| Bits | AVG7 | AVG6 | AVG5 | AVG4 | AVG3 | AVG2 | AVG1 | AVG0 |
|---------|------|------|------|------|------|------|------|------|
| Default | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

AVG<7:0> -- Storage field luminance average value if register 20 bit 6=1.

Notice: for QVGA and Progressive Scan mode, the real luminance average value is double of this register value, other mode is same. If set to RGB raw data mode, the value is Green component average value.

SECTION 2 PIN DESCRIPTION

2.1 PINOUT

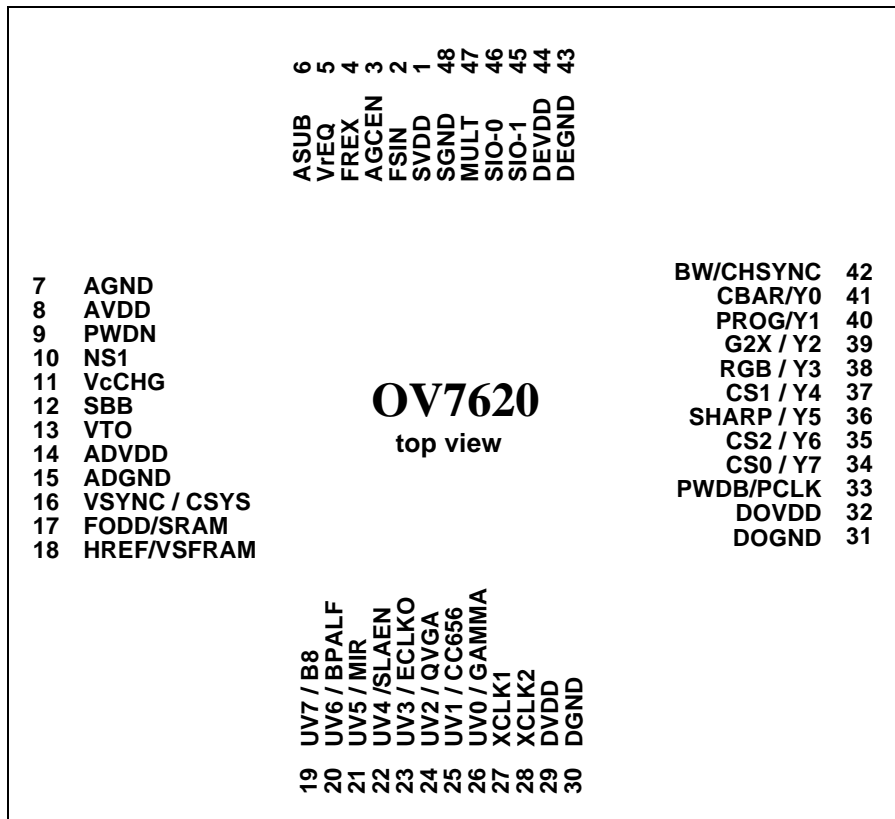

FIG 2.1 OV7620 48Pin Digital Package

ELECTRICAL SPECIFICATION

Table 3.1: DC CHARACTERISTICS ($0^{\circ}\text{C} \leq \text{TA} \leq 85^{\circ}\text{C}$, Voltages referenced to GND)

| Symbol | Descriptions | Min | Max | Typ | Units |
|----------------------------------------------------------------|----------------------------------------------------------------------------------------------|------------|----------------------|------------|--------|
| Supply | | | | | |
| V _{DD1} | Supply voltage- internal analog DEVDD,ADVDD,AVDD,SVDD,AOVDD,DVDD | 4.75 | 5.25 | 5.0 | V |
| V _{DD2} | Supply voltage - internal digital & output digital (DOVDD) | 4.5 3.0 | 5.5 3.6 | 5.0 3.3 | V V |
| I _{DD1} | Supply Current (@ 60Hz frame rate & 5 volt digital I/O, 25pf + 1TTL load on 16 bit data bus) | - | 40 | - | mA |
| I _{DD2} | Standby supply current | - | 10 | 5 | uA |
| Digital Inputs | | | | | |
| V _{IL} | input voltage LOW | - | 0.8 | - | V |
| V _{IH} | input voltage HIGH | 2.0 | - | - | V |
| C _{in} | input capacitor | - | 10 | - | pF |
| Digital Outputs - standard load 25pf, 1.2kΩ to 3.0volts | | | | | |
| V _{OH} | output voltage HIGH | 2.4 | - | - | V |
| V _{OL} | output voltage LOW | - | 0.6 | - | V |
| SCCB Inputs - | | | | | |
| V _{IL} | SIO-0 and SIO-1 (V _{DD2} =5V) | -0.5 | 1.5 | 0 | V |
| V _{IH} | SIO-0 and SIO-1 (V _{DD2} =5V) | 3.0 | V _{dd} + .5 | 5 | V |
| V _{IL} | SIO-0 and SIO-1 (V _{DD2} =3V) | -0.5 | 1 | 0 | V |
| V _{IH} | SIO-0 and SIO-1 (V _{DD2} =3V) | 2.5 | 3.5 | 3 | |

Table 3.2: ANALOG CHARACTERISTICS ($T_A=25^\circ\text{C}$; $V_{dd}=5\text{V}$)

| Symbol | Descriptions | Min | Max | Typ | Units |
|----------------------------------------------------------------------------------------|-------------------------------------------|-----|-----|-----|------------|
| RGB/YCrCb output | | | | | |
| I_{so} | maximum sourcing current | | | 15 | mA |
| V_{rgb} | DC level at zero signal | | | 1 | V |
| | RGB peak-peak amplitude | | | 1 | V |
| V_y | DC level at zero signal | | | 1 | V |
| | Y peak-peak 100% amplitude (without sync) | | | 1 | V |
| | sync amplitude | | | 0.3 | V |
| V_{ry} | DC level at zero signal | | | 1.2 | V |
| | Cr peak-peak (75% saturation) | | | 700 | mV |
| V_{by} | DC level at zero signal | | | 1.2 | V |
| | Cb peak-peak (75% saturation) | | | 890 | mV |
| User Adjustable Controls (VcBRT) | | | | | |
| R_i | input resistance | | | 100 | K Ω |
| factory set reference bias (VrAD1,VrAD2,VrAD3,VrEQ,VrPK,NSSA1,VcCHG, VcBLM) | | | | | |
| VrEQ | biased level | 2.0 | 3.0 | 2.5 | V |
| NS1SA1 | SA1 reference level | | | 2.2 | V |
| VcCHG | Photo cell Charge level | | | 2.6 | V |
| ADC parameters | | | | | |
| B | analog bandwidth | | | | MHz |
| DLE | DC differential linearity error | | | 0.5 | LSB |
| ILE | DC integral linearity error | | | 0.5 | LSB |

Table 3.3: AC CHARACTERISTICS ($0^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$, Voltages referenced to GND)

| Symbol | Descriptions | Min | Max | Typ | Units |
|----------------------------------|--------------------------------------------------------|----------|-----|------|----------|
| Oscillator & Clock in | | | | | |

3. Different Method to get QVGA format Compare

Table 3.4: Compare of QVGA Method

| Method | Resolution | Frame Rate | Lens |
|---------------|-------------------|-------------------|-------------|
| A | 320x240 | 60 frame/s | 1/3" |
| B | 320x240 | 30 frame/s | 1/3" |
| C | 322x240 | 30 frame/s | 1/4" |
| D | 354x288 | 30 frame/s | 1/4" |

Note: To get the frame rate, OV7620 must use 27 MHz crystal.
