SCES613A - OCTOBER 2004 - REVISED DECEMBER 2004

- Available in the Texas Instruments NanoStar™ and NanoFree™ Packages
- Single-Supply Voltage Translator
 - 1.8 V to 3.3 V (at $V_{CC} = 3.3 \text{ V}$)
 - $2.5 \text{ V to } 3.3 \text{ V (at V}_{CC} = 3.3 \text{ V)}$
 - 1.8 V to 2.5 V (at $V_{CC} = 2.5 \text{ V}$)
 - $3.3 \text{ V to } 2.5 \text{ V (at V}_{CC} = 2.5 \text{ V)}$
- Nine Configurable Gate Logic Functions
- Schmitt-Trigger Inputs Reject Input Noise and Provide Better Output Signal Integrity
- I_{off} Supports Partial-Power-Down Mode With Low Leakage Current (0.5 μA)
- 200-ns/V Input Rise/Fall Time Allows Slow Transition of Input Signal

 Very Low Static and Dynamic Power Consumption

- Pb-Free Packages Available: SOT-23 (DBV), SC-70 (DCK), WCSP (NanoFree)
- Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II
- ESD Performance Tested Per JESD 22
 - 2000-V Human-Body Model (A114-B, Class II)
 - 200-V Machine Model (A115-A)
 - 1000-V Charged-Device Model (C101)
- Related Devices: AUP1T98/57/58

description/ordering information

AUP technology is the industry's lowest-power logic technology designed for use in battery-operated or battery backed-up equipment. The SN74AUP1T97 is designed for logic level translation applications with input switching levels that accept 1.8-V LVCMOS signals, while operating from either a single 3.3-V or 2.5-V $_{\rm CC}$ supply.

The wide V_{CC} range of 2.3 V to 3.6 V allows the possibility of battery voltage drop during system operation and ensures normal operation between this range.

Schmitt-trigger inputs ($\Delta V_T = 210 \text{ mV}$ between positive and negative input transitions) offer improved noise immunity during switching transitions, which is especially useful on analog-mixed mode designs. Schmitt-trigger inputs reject input noise, ensure integrity of output signals, and also allow for slow input signal transition.

The AUP1T97 can be easily configured to perform a required gate function by connecting A, B, and C inputs to V_{CC} or ground (see Function Selection Table). Up to nine commonly used logic gate functions can be performed.

 I_{off} is a feature that allows for powered-down conditions ($V_{CC} = 0$ V) and is important in portable and mobile applications. When $V_{CC} = 0$ V, signals in the range from 0 V to 3.6 V can be applied to the inputs and outputs of the device. No damage will occur to the device under these conditions.

AUP1T97 is designed with optimized current drive capability of 4 mA to reduce line reflections, overshoot, and undershoot caused by high drive outputs.

Nanostar[™] and Nanofree[™] package technology is a major breakthrough in IC packaging concepts, using the die as the package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

[†] Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.
