

TOSHIBA BIPOLAR LINEAR INTEGRATED CIRCUIT SILICON MONOLITHIC

TA8126S, TA8126F

DC/DC CONVERTER FOR ELECTRIC TUNING (3V USE)

The TA8126S, TA8126F are DC/DC converter ICs, which are designed for biasing varactor diodes of tuner system. Those items are especially suitable for supplying high voltage (about 15V/30V) for electric tuning (FM/TV/UHF/AM) system of headphone stereos, radio cassette recorders, or other equipments.

FEATURES

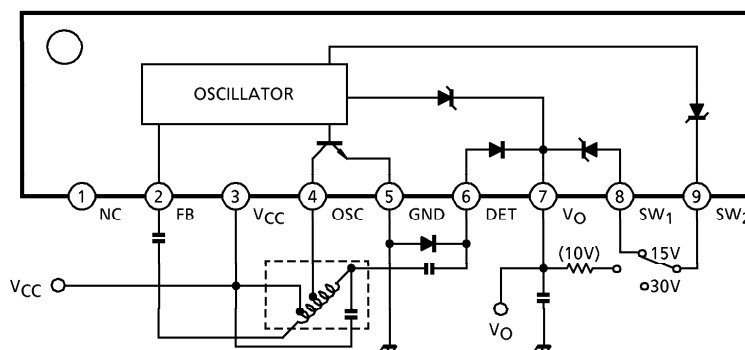

- Excellent regulatory capability of output voltage against fluctuation of supply voltage, and of ambient temperature.
- Excellent spurious radiation by oscillation of sine wave.
- Output voltage can be switched over to 15V or 30V by one-make switch, and is applicable to 10V, too.
- Few external parts.
- Low supply current (at non-load, $V_{CC} = 3V$, $T_a = 25^\circ C$)
 $I_{CCQ1} = 2.4mA$ (Typ., $V_O = 15V$ Mode)
 $I_{CCQ2} = 3.0mA$ (Typ., $V_O = 30V$ Mode)
- Operating supply voltage range ($T_a = 25^\circ C$)
 $V_{CC1} (opr) = 1.8 \sim 10V$, ($V_O = 15V$ Mode)
 $V_{CC2} (opr) = 2.0 \sim 10V$, ($V_O = 30V$ Mode)

Weight	
SIP9-P-2.54C	: 0.72g (Typ.)
SSOP10-P-225-1.00	: 0.09g (Typ.)

● TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.

APPLICATION NOTE

1. These ICs have the output voltage by means of boosting the oscillation voltage, derived from Hartley type oscillator circuit and of voltage-double rectifier with C₃, D₁ and D₂.

(1) Designing of oscillation frequency

$$f_{OSC} \doteq \frac{1}{2\pi\sqrt{L_3 C_2}}$$

(2) Coil turns can be designed as following :

$$V_{OSC} (p-p) = 2 (V_{CC} (min) - V_{CE1} (sat))$$

$$n = \frac{n_3}{n_2} \doteq \frac{V_O}{V_{OSC} (p-p)}$$

- (Note) V_{CC} (min) : Minimum of supply voltage designed by a equipment
- V_{CE1} (sat) : Saturation voltage of Q₁
- n : Coil turns ratio (L₂, L₃)
- V_O : Output voltage (V_O ≐ 30V)

The turn of L₁ is designed, so as to make the terminal of FB be about 200~300mV_{p-p} through C₁. The turn of L₁ should be small, and the capacitance of C₁ and Q₀ of coil should be large, for the oscillation start at turning power-on.

(3) Allowance is advisable for coil design of n, Q₀. However, spurious radiation can be reduced, in case that the output current and n of coil don't make large.

2. In case that spurious radiation due to the oscillation is large, it is recommended to provide LC filter on the power supply line as shown in Fig.2.

As for this value, select the optimum one depending on the kind of set.

Fig.2 LC Filter

(/) : TA8126S / F

3. Pattern diagram

The Fig.3 shows the oscillation loop. This pattern diagram should be small, because spurious radiation due to the oscillation is reduced. The Fig.4 shows the rectifier loop. This pattern diagram should be of the small, because spurious radiation due to the switching rectifier is reduced. The two loops should be isolated from other DC lines.

Fig.3 Oscillation loop

Fig.4 Rectifier loop

4. Output voltage application

The output voltage is applicable to about 10V, too, in case of connecting to external resistance "R_x = 30kΩ", as Fig.5. But, in this application, the regulatory circuit doesn't operate, which is against fluctuation of supply voltage and of ambient temperature.

Fig.5 Output voltage application

MAXIMUM RATINGS (T_a = 25°C)

CHARACTERISTIC	SYMBOL	RATING	UNIT
Supply Voltage	V _{CC}	12	V
Output Voltage	V _O	35	V
Power Dissipation	P _D (Note)	750	mW
		400	
Operating Temperature	T _{opr}	- 25~75	°C
Storage Temperature	T _{stg}	- 55~150	°C

(Note) Derated above T_a = 25°C in the proportion of 6mW/°C for TA8126S, and of 3.2mW/°C for TA8126F.

ELECTRICAL CHARACTERISTICS

(Unless otherwise specified : $V_{CC} = 3V$, $T_a = 25^\circ C$, $f_{OSC} = 3.0MHz$, $I_O = 100\mu A$)

CHARACTERISTIC	SYMBOL	TEST CIR-CUIT	SW MODE	TEST CONDITION	MIN.	TYP.	MAX.	UNIT
Supply Current	I_{CCQ1}	—	ON	$I_O = 0$	—	2.4	5	mA
	I_{CCQ2}	—	OFF	$I_O = 0$	—	3	6	
Boosted Output Voltage 1	V_{O1}	—	ON		14.0	15.1	16.0	V
V_{O1} Supply Voltage Fluctuation	ΔV_{O1}	—	ON	$V_{CC} = 10V \rightarrow 1.8V$	-20	0	20	mV
