## MOC3051M, MOC3052M 6-Pin DIP Random-Phase Optoisolators Triac Drivers (600 Volt Peak)

## Features

- Excellent $I_{\text {FT }}$ stability—IR emitting diode has low degradation
- High isolation voltage-minimum 7500 peak VAC

■ Underwriters Laboratory (UL) recognizedFile \#E90700, Volume 2

- 600V peak blocking voltage

■ IEC60747-5-2 approved (File \#94766)

- Ordering option V (e.g. MOC3052VM)

## Applications

■ Solenoid/valve controls

- Lamp ballasts
- Static AC power switch
- Interfacing microprocessors to 115 and 240 Vac peripherals
- Solid state relay
- Incandescent lamp dimmers
- Temperature controls
- Motor controls

## Description

The MOC3051M and MOC3052M consist of a AIGaAs infrared emitting diode optically coupled to a non-zerocrossing silicon bilateral AC switch (triac). These devices isolate low voltage logic from 115 and 240 Vac lines to provide random phase control of high current triacs or thyristors. These devices feature greatly enhanced static dv/dt capability to ensure stable switching performance of inductive loads.

## Schematic

Absolute Maximum Ratings $\left(\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}\right.$ unless otherwise specified.)
Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

*Typical values at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$

## Notes:

2. Test voltage must be applied within dv/dt rating.
3. All devices are guaranteed to trigger at an $\mathrm{I}_{\mathrm{F}}$ value less than or equal to $\max \mathrm{I}_{\mathrm{FT}}$. Therefore, recommended operating $I_{F}$ lies between max. 15A for MOC3051M, 10mA for MOC3052M and absolute max. $I_{F}(60 \mathrm{~mA})$.

## Safety and Insulation Ratings

As per IEC 60747-5-2, this optocoupler is suitable for "safe electrical insulation" only within the safety limit data. Compliance with the safety ratings shall be ensured by means of protective circuits.

## Typical Performance Curves

Figure 1. LED Forward Voltage vs. Forward Current

Figure 3. Trigger Current vs. Ambient Temperature

## $I_{F}$ vs. Temperature (normalized)

Figure 3 shows the increase of the trigger current when the device is expected to operate at an ambient temperature below $25^{\circ} \mathrm{C}$. Multiply the normalized $\mathrm{I}_{\mathrm{FT}}$ shown this graph with the data sheet guaranteed $\mathrm{I}_{\mathrm{FT}}$.
Example:
$\mathrm{T}_{\mathrm{A}}=-40^{\circ} \mathrm{C}, \mathrm{I}_{\mathrm{FT}}=10 \mathrm{~mA}$
$\mathrm{I}_{\mathrm{FT}} @-40^{\circ} \mathrm{C}=10 \mathrm{~mA} \times 1.4=14 \mathrm{~mA}$

## Phase Control Considerations

## LED Trigger Current versus PW (normalized)

Random Phase Triac drivers are designed to be phase controllable. They may be triggered at any phase angle within the AC sine wave. Phase control may be accomplished by an AC line zero cross detector and a variable pulse delay generator which is synchronized to the zero

Figure 4. LED Current Required to Trigger vs. LED Pulse Width

cross detector. The same task can be accomplished by a microprocessor which is synchronized to the AC zero crossing. The phase controlled trigger current may be a very short pulse which saves energy delivered to the input LED. LED trigger pulse currents shorter than $100 \mu \mathrm{~s}$ must have an increased amplitude as shown on Figure 4. This graph shows the dependency of the trigger current $\mathrm{I}_{\mathrm{FT}}$ versus the pulse width can be seen on the chart delay $\mathrm{t}(\mathrm{d})$ versus the LED trigger current.
$I_{F T}$ in the graph $I_{F T}$ versus (PW) is normalized in respect to the minimum specified $\mathrm{I}_{\mathrm{FT}}$ for static condition, which is specified in the device characteristic. The normalized $\mathrm{I}_{\mathrm{FT}}$ has to be multiplied with the devices guaranteed static trigger current.

## Example:

Guaranteed $\mathrm{I}_{\mathrm{FT}}=10 \mathrm{~mA}$, Trigger pulse width $\mathrm{PW}=3 \mu \mathrm{~s}$ $\mathrm{I}_{\mathrm{FT}}($ pulsed $)=10 \mathrm{~mA} \times 5=50 \mathrm{~mA}$

## Minimum LED Off Time in Phase Control Applications

In Phase control applications one intends to be able to control each AC sine half wave from $0^{\circ}$ to $180^{\circ}$. Turn on at $0^{\circ}$ means full power and turn on at $180^{\circ}$ means zero power. This is not quite possible in reality because triac driver and triac have a fixed turn on time when activated at zero degrees. At a phase control angle close to $180^{\circ}$ the driver's turn on pulse at the trailing edge of the AC sine wave must be limited to end 200 ms before AC zero cross as shown in Figure 5. This assures that the triac driver has time to switch off. Shorter times may cause loss of control at the following half cycle.

## $I_{\mathrm{FT}}$ versus dv/dt

Triac drivers with good noise immunity (dv/dt static) have internal noise rejection circuits which prevent false
triggering of the device in the event of fast raising line voltage transients. Inductive loads generate a commutating dv/dt that may activate the triac drivers noise suppression circuits. This prevents the device from turning on at its specified trigger current. It will in this case go into the mode of "half waving" of the load. Half waving of the load may destroy the power triac and the load.
Figure 8 shows the dependency of the triac drivers $\mathrm{I}_{\mathrm{FT}}$ versus the reapplied voltage rise with a Vp of 400V. This dv/dt condition simulates a worst case commutating dv/dt amplitude.

It can be seen that the $I_{\text {FT }}$ does not change until a commutating $\mathrm{dv} / \mathrm{dt}$ reaches $1000 \mathrm{~V} / \mathrm{ms}$. The data sheet specified $I_{F T}$ is therefore applicable for all practical inductive loads and load factors.

Figure. 7 Leakage Current, $I_{\text {DRM }}$ vs. Temperature

Figure. 8 LED Trigger Current, $\mathrm{I}_{\text {FT }}$ vs. dv/dt

## $t$ (delay), $t(f)$ versus $I_{F T}$

The triac driver's turn on switching speed consists of a turn on delay time $\mathrm{t}(\mathrm{d})$ and a fall time $\mathrm{t}(\mathrm{f})$. Figure 9 shows that the delay time depends on the LED trigger current, while the actual trigger transition time $\mathrm{t}(\mathrm{f})$ stays constant with about one micro second.

The delay time is important in very short pulsed operation because it demands a higher trigger current at very short trigger pulses. This dependency is shown in the graph $\mathrm{I}_{\mathrm{FT}}$ vs. LED PW.

The turn on transition time $\mathrm{t}(\mathrm{f})$ combined with the power triac's turn on time is important to the power dissipation of this device.

## Switching Time Test Circuit

Figure 9. Delay Time, $\mathbf{t}(\mathrm{d})$, and Fall Time, $\mathrm{t}(\mathrm{f})$, vs. LED Trigger Current

1. The mercury wetted relay provides a high speed repeated pulse to the D.U.T.
2. 100 x scope probes are used, to allow high speeds and voltages.
3. The worst-case condition for static dv/dt is established by triggering the D.U.T. with a normal LED input current, then removing the current. The variable $\mathrm{R}_{\text {TEST }}$ allows the dv/dt to be gradually increased until the D.U.T. continues to trigger in response to the applied voltage pulse, even after the LED current has been removed. The dv/dt is then decreased until the D.U.T. stops triggering. $\tau_{\mathrm{RC}}$ is measured at this point and recorded.

Figure 10. Static dv/dt Test Circuit

## Applications Guide

## Basic Triac Driver Circuit

The new random phase triac driver family MOC3052M and MOC3051M are very immune to static $\mathrm{dv} / \mathrm{dt}$ which allows snubberless operations in all applications where external generated noise in the AC line is below its guaranteed dv/dt withstand capability. For these applications a snubber circuit is not necessary when a noise insensitive power triac is used. Figure 11 shows the circuit diagram. The triac driver is directly connected to the triac main terminal 2 and a series Resistor $R$ which limits the current to the triac driver. Current limiting resistor $R$ must have a minimum value which restricts the current into the driver to maximum 1A.

$$
\mathrm{R}=\mathrm{Vp} \mathrm{AC} / \mathrm{I}_{\mathrm{TM}} \max \text { rep. }=\mathrm{Vp} \mathrm{AC} / 1 \mathrm{~A}
$$

The power dissipation of this current limiting resistor and the triac driver is very small because the power triac carries the load current as soon as the current through driver and current limiting resistor reaches the trigger current of the power triac. The switching transition times for the driver is only one micro second and for power triacs typical four micro seconds.

Figure 11. Basic Driver Circuit

## Triac Driver Circuit for Noisy Environments

When the transient rate of rise and amplitude are expected to exceed the power triacs and triac drivers maximum ratings a snubber circuit as shown in Figure 12 is recommended. Fast transients are slowed by the R-C snubber and excessive amplitudes are clipped by the Metal Oxide Varistor MOV.

## Triac Driver Circuit for Extremely Noisy Environments

As specified in the noise standards IEEE472 and IEC255-4.

Industrial control applications do specify a maximum transient noise $\mathrm{dv} / \mathrm{dt}$ and peak voltage which is superimposed onto the AC line voltage. In order to pass this environment noise test a modified snubber network as shown in Figure 13 is recommended.

## DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

## LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

## As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

## ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Sales Support.
Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.
