Data Sheet

Description

The Avago ACPL-M71T and ACPL-M72T are high temperature, digital CMOS optocouplers in SOIC-5 packages. Suitable for hybrid and electric vehicle applications, the optocouplers use the latest CMOS IC technology to achieve outstanding performance and very low power consumption. All devices are AEC-Q100 compliant and operate over the -40°C to 125 °C temperature range.

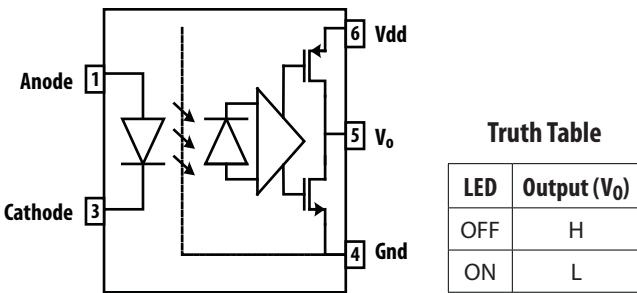

The ACPL-M71T uses a high speed LED, and the ACPL-M72T uses a low current LED for lower power dissipation. The high speed ACPL-M71T featuring a 35 ns maximum propagation delay ($I_F = 10 \text{ mA}$). The ACPL-M72T optocoupler features very low power. With a low 4 mA LED drive current, ACPL-M72L typical propagation delay is 60 ns.

Each digital optocoupler has a CMOS detector IC, an integrated photodiode, a high speed transimpedance amplifier, and a voltage comparator with an output driver.

Avago R²Coupler isolation products provide the reinforced insulation and reliability needed for critical in automotive and high temperature industrial applications

Notes:

1. t_{PHL} propagation delay is measured from the 50% (V_{in} or I_f) on the rising edge of the input pulse to 0.8V on the falling edge of the V_O signal. t_{PLH} propagation delay is measured from the 50% (V_{in} or I_f) on the falling edge of the input pulse to the 80% level of the rising edge of the V_O signal.
2. PWD is defined as |t_{PHL} - t_{PLH}|.
3. t_{PSK} is equal to the magnitude of the worst case difference in t_{PHL} and/or t_{PLH} that will be seen between units at any given temperature within the recommended operating conditions.
4. CM_H is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state.
5. CM_L is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state.
