# **Features**

- High-performance, Low-power 8/16-bit AVR XMEGA Microcontroller
- **Non-Volatile Program and Data Memories** 
  - 64K 384K Bytes of In-System Self-Programmable Flash
  - 4K 8K Bytes Boot Section with Independent Lock Bits
  - 2 KB 4 KB EEPROM
  - 4 KB 32 KB Internal SRAM

External Bus Interface for up to 16M bytes SRAM External Bus Interface for up to 128M bit SDRAM

- Peripheral Features
  - Four-channel DMA Controller with support for external requests
  - Eight-channel Event System
  - Eight 16-bit Timer/Counters

Four Timer/Counters with 4 Output Compare or Input Capture channels Four Timer/Counters with 2 Output Compare or Input Capture channels High-Resolution Extension on all Timer/Counters Advanced Waveform Extension on two Timer/Counters

- Eight USARTs

IrDA modulation/demodulation for one USART

- Four Two-Wire Interfaces with dual address match (I<sup>2</sup>C and SMBus compatible)
- Four SPI (Serial Peripheral Interface) peripherals
- AES and DES Crypto Engine
- 16-bit Real Time Counter with separate Oscillator
- Two Eight-channel, 12-bit, 2 Msps Analog to Digital Converters
- Two Two-channel, 12-bit, 1 Msps Digital to Analog Converters
- Four Analog Comparators with Window compare function
- External Interrupts on all General Purpose I/O pins
- Programmable Watchdog Timer with Separate On-chip Ultra Low Power Oscillator
- **Special Microcontroller Features** 
  - Power-on Reset and Programmable Brown-out Detection
  - Internal and External Clock Options with PLL and Prescaler
  - Programmable Multi-level Interrupt Controller
  - Sleep Modes: Idle, Power-down, Standby, Power-save, Extended Standby
  - Advanced Programming, Test and Debugging Interfaces JTAG (IEEE 1149.1 Compliant) Interface for programming, test and debugging PDI (Program and Debug Interface) for programming and debugging
- I/O and Packages
  - 78 Programmable I/O Lines
  - 100 lead TQFP
  - 100 ball CBGA
  - 100 ball VFBGA
- Operating Voltage
  - -1.6 3.6V
- Speed performance
  - 0 12 MHz @ 1.6 3.6V
  - 0 32 MHz @ 2.7 3.6V

# 3. Overview

The XMEGA<sup>™</sup> A1 is a family of low power, high performance and peripheral rich CMOS 8/16-bit microcontrollers based on the AVR<sup>®</sup> enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the XMEGA A1 achieves throughputs approaching 1 Million Instructions Per Second (MIPS) per MHz allowing the system designer to optimize power consumption versus processing speed.

The AVR CPU combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction, executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs many times faster than conventional single-accumulator or CISC based microcontrollers.

The XMEGA A1 devices provides the following features: In-System Programmable Flash with Read-While-Write capabilities, Internal EEPROM and SRAM, four-channel DMA Controller, eight-channel Event System, Programmable Multi-level Interrupt Controller, 78 general purpose I/O lines, 16-bit Real Time Counter (RTC), eight flexible 16-bit Timer/Counters with compare modes and PWM, eight USARTs, four Two Wire Serial Interfaces (TWIs), four Serial Peripheral Interfaces (SPIs), AES and DES crypto engine, two 8-channel, 12-bit ADCs with optional differential input with programmable gain, two 2-channel, 12-bit DACs, four analog comparators with window mode, programmable Watchdog Timer with seperate Internal Oscillator, accurate internal oscillators with PLL and prescaler and programmable Brown-Out Detection.

The Program and Debug Interface (PDI), a fast 2-pin interface for programming and debugging, is available. The devices also have an IEEE std. 1149.1 compliant JTAG test interface, and this can also be used for On-chip Debug and programming.

The XMEGA A1 devices have five software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, DMA Controller, Event System, Interrupt Controller and all peripherals to continue functioning. The Power-down mode saves the SRAM and register contents but stops the oscillators, disabling all other functions until the next TWI or pin-change interrupt, or Reset. In Power-save mode, the asynchronous Real Time Counter continues to run, allowing the application to maintain a timer base while the rest of the device is sleeping. In Standby mode, the Crystal/Resonator Oscillator is kept running while the rest of the device is sleeping. This allows very fast start-up from external crystal combined with low power consumption. In Extended Standby mode, both the main Oscillator and the Asynchronous Timer continue to run. To further reduce power consumption, the peripheral clock to each individual peripheral can optionally be stopped in Active mode and Idle sleep mode.

The device is manufactured using Atmel's high-density nonvolatile memory technology. The program Flash memory can be reprogrammed in-system through the PDI or JTAG. A Bootloader running in the device can use any interface to download the application program to the Flash memory. The Bootloader software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8/16-bit RISC CPU with In-System Self-Programmable Flash, the Atmel XMEGA A1 is a powerful microcontroller family that provides a highly flexible and cost effective solution for many embedded applications.

The XMEGA A1 devices are supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, programmers, and evaluation kits.

# 5. Disclaimer

For devices that are not available yet, typical values contained in this datasheet are based on simulations and characterization of other AVR XMEGA microcontrollers manufactured on the same process technology. Min. and Max values will be available after the device is characterized.

# 6. AVR CPU

# 6.1 Features

- 8/16-bit high performance AVR RISC Architecture
  - 138 instructions
  - Hardware multiplier
- 32x8-bit registers directly connected to the ALU
- Stack in SRAM
- Stack Pointer accessible in I/O memory space
- Direct addressing of up to 16M Bytes of program and data memory
- True 16/24-bit access to 16/24-bit I/O registers
- Support for 8-, 16- and 32-bit Arithmetic
- Configuration Change Protection of system critical features

## 6.2 Overview

The XMEGA A1 uses the 8/16-bit AVR CPU. The main function of the CPU is program execution. The CPU must therefore be able to access memories, perform calculations and control peripherals. Interrupt handling is described in a separate section. Figure 6-1 on page 8 shows the CPU block diagram.

Figure 6-1. CPU block diagram

The AVR uses a Harvard architecture - with separate memories and buses for program and data. Instructions in the program memory are executed with a single level pipeline. While one instruction is being executed, the next instruction is pre-fetched from the program memory. This

concept enables instructions to be executed in every clock cycle. The program memory is In-System Self-Programmable Flash memory.

# 6.3 Register File

The fast-access Register File contains 32 x 8-bit general purpose working registers with single clock cycle access time. This allows single-cycle Arithmetic Logic Unit (ALU) operation. In a typical ALU cycle, the operation is performed on two Register File operands, and the result is stored back in the Register File.

Six of the 32 registers can be used as three 16-bit address register pointers for data space addressing - enabling efficient address calculations. One of these address pointers can also be used as an address pointer for look up tables in Flash program memory.

# 6.4 ALU - Arithmetic Logic Unit

The high performance Arithmetic Logic Unit (ALU) supports arithmetic and logic operations between registers or between a constant and a register. Single register operations can also be executed. Within a single clock cycle, arithmetic operations between general purpose registers or between a register and an immediate are executed. After an arithmetic or logic operation, the Status Register is updated to reflect information about the result of the operation.

The ALU operations are divided into three main categories – arithmetic, logical, and bit-functions. Both 8- and 16-bit arithmetic is supported, and the instruction set allows for efficient implementation of 32-bit aritmetic. The ALU also provides a powerful multiplier supporting both signed and unsigned multiplication and fractional format.

# 6.5 Program Flow

When the device is powered on, the CPU starts to execute instructions from the lowest address in the Flash Program Memory '0'. The Program Counter (PC) addresses the next instruction to be fetched. After a reset, the PC is set to location '0'.

Program flow is provided by conditional and unconditional jump and call instructions, capable of addressing the whole address space directly. Most AVR instructions use a 16-bit word format, while a limited number uses a 32-bit format.

During interrupts and subroutine calls, the return address PC is stored on the Stack. The Stack is effectively allocated in the general data SRAM, and consequently the Stack size is only limited by the total SRAM size and the usage of the SRAM. After reset the Stack Pointer (SP) points to the highest address in the internal SRAM. The SP is read/write accessible in the I/O memory space, enabling easy implementation of multiple stacks or stack areas. The data SRAM can easily be accessed through the five different addressing modes supported in the AVR CPU.

# 7. Memories

## 7.1 Features

- Flash Program Memory
  - One linear address space
  - In-System Programmable
  - Self-Programming and Bootloader support
  - Application Section for application code
  - Application Table Section for application code or data storage
  - Boot Section for application code or bootloader code
  - Separate lock bits and protection for all sections
  - Built in fast CRC check of a selectable flash program memory section
- Data Memory
  - One linear address space
  - Single cycle access from CPU
  - SRAM
  - EEPROM

Byte and page accessible

Optional memory mapping for direct load and store

- I/O Memory

Configuration and Status registers for all peripherals and modules 16 bit-accessible General Purpose Register for global variables or flags

- External Memory support

**SRAM** 

**SDRAM** 

Memory mapped external hardware

- Bus arbitration

Safe and deterministic handling of CPU and DMA Controller priority

- Separate buses for SRAM, EEPROM, I/O Memory and External Memory access
  - Simultaneous bus access for CPU and DMA Controller
- Production Signature Row Memory for factory programmed data

Device ID for each microcontroller device type

Serial number for each device

Oscillator calibration bytes

ADC, DAC and temperature sensor calibration data

• User Signature Row

One flash page in size

Can be read and written from software

Content is kept after chip erase

## 7.2 Overview

The AVR architecture has two main memory spaces, the Program Memory and the Data Memory. In addition, the XMEGA A1 features an EEPROM Memory for non-volatile data storage. All three memory spaces are linear and require no paging. The available memory size configurations are shown in "Ordering Information" on page 2. In addition each device has a Flash memory signature row for calibration data, device identification, serial number etc.

Non-volatile memory spaces can be locked for further write or read/write operations. This prevents unrestricted access to the application software.

# 7.3 In-System Programmable Flash Program Memory

The XMEGA A1 devices contain On-chip In-System Programmable Flash memory for program storage, see Figure 7-1 on page 11. Since all AVR instructions are 16- or 32-bits wide, each Flash address location is 16 bits.

The Program Flash memory space is divided into Application and Boot sections. Both sections have dedicated Lock Bits for setting restrictions on write or read/write operations. The Store Program Memory (SPM) instruction must reside in the Boot Section when used to write to the Flash memory.

A third section inside the Application section is referred to as the Application Table section which has separate Lock bits for storage of write or read/write protection. The Application Table section can be used for storing non-volatile data or application software.

Figure 7-1. Flash Program Memory (Hexadecimal address)

#### **Word Address** 0 Application Section (Bytes) (384K/256K/192K/128K/64K) **EFFF** 77FF 2EFFF 1EFFF 16FFF 17000 2F000 1F000 F000 7800 / / / Application Table Section (Bytes) (8K/8K/8K/4K) 2FFFF 1FFFF 17FFF **FFFF** 7FFF 30000 / 20000 18000 10000 8000 Boot Section (Bytes) (8K/8K/8K/4K) 30FFF 20FFF 18FFF 10FFF 87FF

The Application Table Section and Boot Section can also be used for general application software.

# 7.4 Data Memory

The Data Memory consists of the I/O Memory, EEPROM and SRAM memories, all within one linear address space, see Figure 7-2 on page 11. To simplify development, the memory map for all devices in the family is identical and with empty, reserved memory space for smaller devices.

Figure 7-2. Data Memory Map (Hexadecimal address)

#### 7.4.1 I/O Memory

All peripherals and modules are addressable through I/O memory locations in the data memory space. All I/O memory locations can be accessed by the Load (LD/LDS/LDD) and Store (ST/STS/STD) instructions, transferring data between the 32 general purpose registers in the CPU and the I/O Memory.

The IN and OUT instructions can address I/O memory locations in the range 0x00 - 0x3F directly.

I/O registers within the address range 0x00 - 0x1F are directly bit-accessible using the SBI and CBI instructions. The value of single bits can be checked by using the SBIS and SBIC instructions on these registers.

The I/O memory address for all peripherals and modules in XMEGA A1 is shown in the "Peripheral Module Address Map" on page 55.

#### 7.4.2 **SRAM Data Memory**

The XMEGA A1 devices has internal SRAM memory for data storage.

#### 7.4.3 **EEPROM Data Memory**

The XMEGA A1 devices have internal EEPROM memory for non-volatile data storage. It is addressable either in a separate data space or it can be memory mapped into the normal data memory space. The EEPROM memory supports both byte and page access.

### 7.4.4 EBI - External Bus Interface

- · Supports SRAM up to
  - 512K Bytes using 2-port EBI
  - 16M Bytes using 3-port EBI
- Supports SDRAM up to
  - 128M bit using 3-port EBI
- Four software configurable Chip Selects
- Software configurable Wait State insertion
- Clocked from the Peripheral 2x Clock at up to two times the CPU clock speed

The External Bus Interface (EBI) is the interface for connecting external peripheral and memory to the data memory space. The XMEGA A1 has 3 ports that can be used for the EBI. It can interface external SRAM, SDRAM, and/or peripherals such as LCD displays and other memory mapped devices.

The address space, and the number of pins used, for the external memory is selectable from 256 bytes (8-bit) and up to 16M bytes (24-bit). Various multiplexing modes for address and data lines can be selected for optimal use of pins when more or less pins is available for the EBI.

Each of the four chip selects has seperate configuration, and can be configured for SRAM, SRAM Low Pin Count (LPC) or SDRAM. The data memory address space associated for each chip select is decided by a configurable base address and address size for each chip celect.

For SDRAM both 4-bit SDRAM is supported, and SDRAM configurations such as CAS Latency and Refresh rate is configurable in software.

The EBI is clocked from the Peripheral 2x Clock, running up to two times faster than the CPU and supporting speeds of up to 64 MHz.

# 7.5 Production Signature Row

The Production Signature Row is a separate memory section for factory programmed data. It contains calibration data for functions such as oscillators and analog modules.

The production signature row also contains a device ID that identify each microcontroller device type, and a serial number that is unique for each manufactured device. The device ID for the available XMEGA A1 devices is shown in Table 7-1 on page 14. The serial number consist of the production LOT number, wafer number, and wafer coordinates for the device.

The production signature row can not be written or erased, but it can be read from both application software and external programming.

**Table 7-1.** Device ID bytes for XMEGA A1 devices.

| Device       | Device Device ID bytes |        |        |
|--------------|------------------------|--------|--------|
|              | Byte 2                 | Byte 1 | Byte 0 |
| ATxmega64A1  | 4E                     | 96     | 1E     |
| ATxmega128A1 | 4C                     | 97     | 1E     |
| ATxmega192A1 | 4E                     | 97     | 1E     |
| ATxmega256A1 | 46                     | 98     | 1E     |
| ATxmega384A1 | TBD                    | TBD    | TBD    |

# 7.6 User Signature Row

The User Signature Row is a separate memory section that is fully accessible (read and write) from application software and external programming. The user signature row is one flash page in size, and is meant for static user parameter storage, such as calibration data, custom serial numbers or identification numbers, random number seeds etc. This section is not erased by Chip Erase commands that erase the Flash, and requires a dedicated erase command. This ensures parameter storage during multiple program/erase session and on-chip debug sessions.

# 7.7 Flash and EEPROM Page Size

The Flash Program Memory and EEPROM data memory is organized in pages. The pages are word accessible for the Flash and byte accessible for the EEPROM.

Table 7-2 on page 15 shows the Flash Program Memory organization. Flash write and erase operations are performed on one page at a time, while reading the Flash is done one byte at a time. For Flash access the Z-pointer (Z[m:n]) is used for addressing. The most significant bits in the address (FPAGE) gives the page number and the least significant address bits (FWORD) gives the word in the page.

| Devices      | Flash        | Page Size | FWORD  | FPAGE   | Application  |             | Boot         |             |
|--------------|--------------|-----------|--------|---------|--------------|-------------|--------------|-------------|
|              | Size (Bytes) | (words)   |        |         | Size (Bytes) | No of Pages | Size (Bytes) | No of Pages |
| ATxmega64A1  | 64K + 4K     | 128       | Z[7:1] | Z[16:8] | 64K          | 256         | 4K           | 16          |
| ATxmega128A1 | 128K + 8K    | 256       | Z[8:1] | Z[17:9] | 128K         | 256         | 8K           | 16          |
| ATxmega192A1 | 192K + 8K    | 256       | Z[8:1] | Z[18:9] | 192K         | 384         | 8K           | 16          |
| ATxmega256A1 | 256K + 8K    | 256       | Z[8:1] | Z[18:9] | 256K         | 512         | 8K           | 16          |
| ATxmega384A1 | 384K + 8K    | 256       | Z[8:1] | Z[19:9] | 384K         | 768         | 8K           | 16          |

**Table 7-2.** Number of words and Pages in the Flash.

Table 7-3 on page 15 shows EEPROM memory organization for the XMEGA A1 devices. EEPROM write and erase operations can be performed one page or one byte at a time, while reading the EEPROM is done one byte at a time. For EEPROM access the NVM Address Register (ADDR[m:n]) is used for addressing. The most significant bits in the address (E2PAGE) gives the page number and the least significant address bits (E2BYTE) gives the byte in the page.

**Table 7-3.** Number of Bytes and Pages in the EEPROM.

| Devices      | EEPROM | Page Size | E2BYTE    | E2PAGE     | No of Pages |
|--------------|--------|-----------|-----------|------------|-------------|
|              | Size   | (Bytes)   |           |            |             |
| ATxmega64A1  | 2 KB   | 32        | ADDR[4:0] | ADDR[10:5] | 64          |
| ATxmega128A1 | 2 KB   | 32        | ADDR[4:0] | ADDR[10:5] | 64          |
| ATxmega192A1 | 2 KB   | 32        | ADDR[4:0] | ADDR[10:5] | 64          |
| ATxmega256A1 | 4 KB   | 32        | ADDR[4:0] | ADDR[11:5] | 128         |
| ATxmega384A1 | 4 KB   | 32        | ADDR[4:0] | ADDR[11:5] | 128         |

# 8. DMAC - Direct Memory Access Controller

# 8.1 Features

- Allows High-speed data transfer
  - From memory to peripheral
  - From memory to memory
  - From peripheral to memory
  - From peripheral to peripheral
- 4 Channels
- From 1 byte and up to 16M bytes transfers in a single transaction
- . Multiple addressing modes for source and destination address
  - Increment
  - Decrement
  - Static
- 1, 2, 4, or 8 byte Burst Transfers
- Programmable priority between channels

## 8.2 Overview

The XMEGA A1 has a Direct Memory Access (DMA) Controller to move data between memories and peripherals in the data space. The DMA controller uses the same data bus as the CPU to transfer data.

It has 4 channels that can be configured independently. Each DMA channel can perform data transfers in blocks of configurable size from 1 to 64K bytes. A repeat counter can be used to repeat each block transfer for single transactions up to 16M bytes. Each DMA channel can be configured to access the source and destination memory address with incrementing, decrementing or static addressing. The addressing is independent for source and destination address. When the transaction is complete the original source and destination address can automatically be reloaded to be ready for the next transaction.

The DMAC can access all the peripherals through their I/O memory registers, and the DMA may be used for automatic transfer of data to/from communication modules, as well as automatic data retrieval from ADC conversions, data transfer to DAC conversions, or data transfer to or from port pins. A wide range of transfer triggers is available from the peripherals, Event System and software. Each DMA channel has different transfer triggers.

To allow for continuous transfers, two channels can be interlinked so that the second takes over the transfer when the first is finished and vice versa.

The DMA controller can read from memory mapped EEPROM, but it cannot write to the EEPROM or access the Flash.

# Event System

## 9.1 Features

- Inter-peripheral communication and signalling with minimum latency
- CPU and DMA independent operation
- 8 Event Channels allows for up to 8 signals to be routed at the same time
- Events can be generated by
  - Timer/Counters (TCxn)
  - Real Time Counter (RTC)
  - Analog to Digital Converters (ADCx)
  - Analog Comparators (ACx)
  - Ports (PORTx)
  - System Clock (Clk<sub>SYS</sub>)
  - Software (CPU)
- · Events can be used by
  - Timer/Counters (TCxn)
  - Analog to Digital Converters (ADCx)
  - Digital to Analog Converters (DACx)
  - Ports (PORTx)
  - DMA Controller (DMAC)
  - IR Communication Module (IRCOM)
- The same event can be used by multiple peripherals for synchronized timing
- Advanced Features
  - Manual Event Generation from software (CPU)
  - Quadrature Decoding
  - Digital Filtering
- Functions in Active and Idle mode

## 9.2 Overview

The Event System is a set of features for inter-peripheral communication. It enables the possibility for a change of state in one peripheral to automatically trigger actions in one or more peripherals. These changes in a peripheral that will trigger actions in other peripherals are configurable by software. It is a simple, but powerful system as it allows for autonomous control of peripherals without any use of interrupts, CPU or DMA resources.

The indication of a change in a peripheral is referred to as an event, and is usually the same as the interrupt conditions for that peripheral. Events are passed between peripherals using a dedicated routing network called the Event Routing Network. Figure 9-1 on page 18 shows a basic block diagram of the Event System with the Event Routing Network and the peripherals to which it is connected. This highly flexible system can be used for simple routing of signals, pin functions or for sequencing of events.

The maximum latency is two CPU clock cycles from when an event is generated in one peripheral, until the actions are triggered in one or more other peripherals.

The Event System is functional in both Active and Idle modes.

Figure 9-1. Event system block diagram.

The Event Routing Network can directly connect together ADCs, DACs, Analog Comparators (ACx), I/O ports (PORTx), the Real-time Counter (RTC), Timer/Counters (T/C) and the IR Communication Module (IRCOM). Events can also be generated from software (CPU).

All events from all peripherals are always routed into the Event Routing Network. This consist of eight multiplexers where each can be configured in software to select which event to be routed into that event channel. All eight event channels are connected to the peripherals that can use events, and each of these peripherals can be configured to use events from one or more event channels to automatically trigger a software selectable action.

# 10. System Clock and Clock options

## 10.1 Features

- Fast start-up time
- Safe run-time clock switching
- Internal Oscillators:
  - 32 MHz run-time calibrated RC oscillator
  - 2 MHz run-time calibrated RC oscillator
  - 32.768 kHz calibrated RC oscillator
  - 32 kHz Ultra Low Power (ULP) oscillator with 1 kHz ouput
- External clock options
  - 0.4 16 MHz Crystal Oscillator
  - 32 kHz Crystal Oscillator
  - External clock
- PLL with internal and external clock options with 1 to 31x multiplication
- Clock Prescalers with 1 to 2048x division
- Fast peripheral clock running at 2 and 4 times the CPU clock speed
- Automatic Run-Time Calibration of internal oscillators
- Crystal Oscillator failure detection

## 10.2 Overview

XMEGA A1 has an advanced clock system, supporting a large number of clock sources. It incorporates both integrated oscillators, external crystal oscillators and resonators. A high frequency Phase Locked Loop (PLL) and clock prescalers can be controlled from software to generate a wide range of clock frequencies from the clock source input.

It is possible to switch between clock sources from software during run-time. After reset the device will always start up running from the 2 Mhz internal oscillator.

A calibration feature is available, and can be used for automatic run-time calibration of the internal 2 MHz and 32 MHz oscillators. This reduce frequency drift over voltage and temperature.

A Crystal Oscillator Failure Monitor can be enabled to issue a Non-Maskable Interrupt and switch to internal oscillator if the external oscillator fails. Figure 10-1 on page 20 shows the principal clock system in XMEGA A1.

Figure 10-1. Clock system overview

Each clock source is briefly described in the following sub-sections.

# 10.3 Clock Options

# 10.3.1 32 kHz Ultra Low Power Internal Oscillator

The 32 kHz Ultra Low Power (ULP) Internal Oscillator is a very low power consumption clock source. It is used for the Watchdog Timer, Brown-Out Detection and as an asynchronous clock source for the Real Time Counter. This oscillator cannot be used as the system clock source, and it cannot be directly controlled from software.

# 10.3.2 32.768 kHz Calibrated Internal Oscillator

The 32.768 kHz Calibrated Internal Oscillator is a high accuracy clock source that can be used as the system clock source or as an asynchronous clock source for the Real Time Counter. It is calibrated during production to provide a default frequency which is close to its nominal frequency.

# 10.3.3 32.768 kHz Crystal Oscillator

The 32.768 kHz Crystal Oscillator is a low power driver for an external watch crystal. It can be used as system clock source or as asynchronous clock source for the Real Time Counter.

## 10.3.4 0.4 - 16 MHz Crystal Oscillator

The 0.4 - 16 MHz Crystal Oscillator is a driver intended for driving both external resonators and crystals ranging from 400 kHz to 16 MHz.

### 10.3.5 2 MHz Run-time Calibrated Internal Oscillator

The 2 MHz Run-time Calibrated Internal Oscillator is a high frequency oscillator. It is calibrated during production to provide a default frequency which is close to its nominal frequency. The oscillator can use the 32 kHz Calibrated Internal Oscillator or the 32 kHz Crystal Oscillator as a source for calibrating the frequency run-time to compensate for temperature and voltage drift hereby optimizing the accuracy of the oscillator.

## 10.3.6 32 MHz Run-time Calibrated Internal Oscillator

The 32 MHz Run-time Calibrated Internal Oscillator is a high frequency oscillator. It is calibrated during production to provide a default frequency which is close to its nominal frequency. The oscillator can use the 32 kHz Calibrated Internal Oscillator or the 32 kHz Crystal Oscillator as a source for calibrating the frequency run-time to compensate for temperature and voltage drift hereby optimizing the accuracy of the oscillator.

# 10.3.7 External Clock input

The external clock input gives the possibility to connect a clock from an external source.

## 10.3.8 PLL with Multiplication factor 1 - 31x

The PLL provides the possibility of multiplying a frequency by any number from 1 to 31. In combination with the prescalers, this gives a wide range of output frequencies from all clock sources.

# 11. Power Management and Sleep Modes

## 11.1 Features

- 5 sleep modes
  - Idle
  - Power-down
  - Power-save
  - Standby
  - Extended standby
- Power Reduction registers to disable clocks to unused peripherals

## 11.2 Overview

The XMEGA A1 provides various sleep modes tailored to reduce power consumption to a minimum. All sleep modes are available and can be entered from Active mode. In Active mode the CPU is executing application code. The application code decides when and what sleep mode to enter. Interrupts from enabled peripherals and all enabled reset sources can restore the microcontroller from sleep to Active mode.

In addition, Power Reduction registers provide a method to stop the clock to individual peripherals from software. When this is done, the current state of the peripheral is frozen and there is no power consumption from that peripheral. This reduces the power consumption in Active mode and Idle sleep mode.

# 11.3 Sleep Modes

### 11.3.1 Idle Mode

In Idle mode the CPU and Non-Volatile Memory are stopped, but all peripherals including the Interrupt Controller, Event System and DMA Controller are kept running. Interrupt requests from all enabled interrupts will wake the device.

# 11.3.2 Power-down Mode

In Power-down mode all system clock sources, and the asynchronous Real Time Counter (RTC) clock source, are stopped. This allows operation of asynchronous modules only. The only interrupts that can wake up the MCU are the Two Wire Interface address match interrupts, and asynchronous port interrupts, e.g pin change.

## 11.3.3 Power-save Mode

Power-save mode is identical to Power-down, with one exception: If the RTC is enabled, it will keep running during sleep and the device can also wake up from RTC interrupts.

## 11.3.4 Standby Mode

Standby mode is identical to Power-down with the exception that all enabled system clock sources are kept running, while the CPU, Peripheral and RTC clocks are stopped. This reduces the wake-up time when external crystals or resonators are used.

## 11.3.5 Extended Standby Mode

Extended Standby mode is identical to Power-save mode with the exception that all enabled system clock sources are kept running while the CPU and Peripheral clocks are stopped. This reduces the wake-up time when external crystals or resonators are used.

# 12. System Control and Reset

## 12.1 Features

- Multiple reset sources for safe operation and device reset
  - Power-On Reset
  - External Reset
  - Watchdog Reset

The Watchdog Timer runs from separate, dedicated oscillator

- Brown-Out Reset
  - Accurate, programmable Brown-Out levels
- JTAG Reset
- PDI reset
- Software reset
- Asynchronous reset
- No running clock in the device is required for reset
- · Reset status register

# 12.2 Resetting the AVR

During reset, all I/O registers are set to their initial values. The SRAM content is not reset. Application execution starts from the Reset Vector. The instruction placed at the Reset Vector should be an Absolute Jump (JMP) instruction to the reset handling routine. By default the Reset Vector address is the lowest Flash program memory address, '0', but it is possible to move the Reset Vector to the first address in the Boot Section.

The I/O ports of the AVR are immediately tri-stated when a reset source goes active.

The reset functionality is asynchronous, so no running clock is required to reset the device.

After the device is reset, the reset source can be determined by the application by reading the Reset Status Register.

## 12.3 Reset Sources

## 12.3.1 Power-On Reset

The MCU is reset when the supply voltage VCC is below the Power-on Reset threshold voltage.

## 12.3.2 External Reset

The MCU is reset when a low level is present on the RESET pin.

# 12.3.3 Watchdog Reset

The MCU is reset when the Watchdog Timer period expires and the Watchdog Reset is enabled. The Watchdog Timer runs from a dedicated oscillator independent of the System Clock. For more details see "WDT - Watchdog Timer" on page 24.

### 12.3.4 Brown-Out Reset

The MCU is reset when the supply voltage VCC is below the Brown-Out Reset threshold voltage and the Brown-out Detector is enabled. The Brown-out threshold voltage is programmable.

### 12.3.5 JTAG reset

The MCU is reset as long as there is a logic one in the Reset Register in one of the scan chains of the JTAG system. Refer to IEEE 1149.1 (JTAG) Boundary-scan for details.

### 12.3.6 PDI reset

The MCU can be reset through the Program and Debug Interface (PDI).

## 12.3.7 Software reset

The MCU can be reset by the CPU writing to a special I/O register through a timed sequence.

# 12.4 WDT - Watchdog Timer

## 12.4.1 Features

- 11 selectable timeout periods, from 8 ms to 8s.
- Two operation modes
  - Standard mode
  - Window mode
- · Runs from the 1 kHz output of the 32 kHz Ultra Low Power oscillator
- Configuration lock to prevent unwanted changes

### 12.4.2 Overview

The XMEGA A1 has a Watchdog Timer (WDT). The WDT will run continuously when turned on and if the Watchdog Timer is not reset within a software configurable time-out period, the microcontroller will be reset. The Watchdog Reset (WDR) instruction must be run by software to reset the WDT, and prevent microcontroller reset.

The WDT has a Window mode. In this mode the WDR instruction must be run within a specified period called a window. Application software can set the minimum and maximum limits for this window. If the WDR instruction is not executed inside the window limits, the microcontroller will be reset.

A protection mechanism using a timed write sequence is implemented in order to prevent unwanted enabling, disabling or change of WDT settings.

For maximum safety, the WDT also has an Always-on mode. This mode is enabled by programming a fuse. In Always-on mode, application software can not disable the WDT.

# 13. PMIC - Programmable Multi-level Interrupt Controller

## 13.1 Features

- Separate interrupt vector for each interrupt
- Short, predictable interrupt response time
- Programmable Multi-level Interrupt Controller
  - 3 programmable interrupt levels
  - Selectable priority scheme within low level interrupts (round-robin or fixed)
  - Non-Maskable Interrupts (NMI)
- Interrupt vectors can be moved to the start of the Boot Section

## 13.2 Overview

XMEGA A1 has a Programmable Multi-level Interrupt Controller (PMIC). All peripherals can define three different priority levels for interrupts; high, medium or low. Medium level interrupts may interrupt low level interrupt service routines. High level interrupts may interrupt both low-and medium level interrupt service routines. Low level interrupts have an optional round robin scheme to make sure all interrupts are serviced within a certain amount of time.

The built in oscillator failure detection mechanism can issue a Non-Maskable Interrupt (NMI).

# 13.3 Interrupt vectors

When an interrupt is serviced, the program counter will jump to the interrupt vector address. The interrupt vector is the sum of the peripheral's base interrupt address and the offset address for specific interrupts in each peripheral. The base addresses for the XMEGA A1 devices are shown in Table 13-1. Offset addresses for each interrupt available in the peripheral are described for each peripheral in the XMEGA A manual. For peripherals or modules that have only one interrupt, the interrupt vector is shown in Table 13-1. The program address is the word address.

Table 13-1. Reset and Interrupt Vectors

| Program Address<br>(Base Address) | Source           | Interrupt Description                             |
|-----------------------------------|------------------|---------------------------------------------------|
| 0x000                             | RESET            |                                                   |
| 0x002                             | OSCF_INT_vect    | Crystal Oscillator Failure Interrupt vector (NMI) |
| 0x004                             | PORTC_INT_base   | Port C Interrupt base                             |
| 0x008                             | PORTR_INT_base   | Port R Interrupt base                             |
| 0x00C                             | DMA_INT_base     | DMA Controller Interrupt base                     |
| 0x014                             | RTC_INT_base     | Real Time Counter Interrupt base                  |
| 0x018                             | TWIC_INT_base    | Two-Wire Interface on Port C Interrupt base       |
| 0x01C                             | TCC0_INT_base    | Timer/Counter 0 on port C Interrupt base          |
| 0x028                             | TCC1_INT_base    | Timer/Counter 1 on port C Interrupt base          |
| 0x030                             | SPIC_INT_vect    | SPI on port C Interrupt vector                    |
| 0x032                             | USARTC0_INT_base | USART 0 on port C Interrupt base                  |
| 0x038                             | USARTC1_INT_base | USART 1 on port C Interrupt base                  |
| 0x03E                             | AES_INT_vect     | AES Interrupt vector                              |

 Table 13-1.
 Reset and Interrupt Vectors (Continued)

| Program Address<br>(Base Address) | Source           | Interrupt Description                                |
|-----------------------------------|------------------|------------------------------------------------------|
| 0x040                             | NVM_INT_base     | Non-Volatile Memory Interrupt base                   |
| 0x044                             | PORTB_INT_base   | Port B Interrupt base                                |
| 0x048                             | ACB_INT_base     | Analog Comparator on Port B Interrupt base           |
| 0x04E                             | ADCB_INT_base    | Analog to Digital Converter on Port B Interrupt base |
| 0x056                             | PORTE_INT_base   | Port E Interrupt base                                |
| 0x05A                             | TWIE_INT_base    | Two-Wire Interface on Port E Interrupt base          |
| 0x05E                             | TCE0_INT_base    | Timer/Counter 0 on port E Interrupt base             |
| 0x06A                             | TCE1_INT_base    | Timer/Counter 1 on port E Interrupt base             |
| 0x072                             | SPIE_INT_vect    | SPI on port E Interrupt vector                       |
| 0x074                             | USARTE0_INT_base | USART 0 on port E Interrupt base                     |
| 0x07A                             | USARTE1_INT_base | USART 1 on port E Interrupt base                     |
| 0x080                             | PORTD_INT_base   | Port D Interrupt base                                |
| 0x084                             | PORTA_INT_base   | Port A Interrupt base                                |

# 14. I/O Ports

## 14.1 Features

- Selectable input and output configuration for each pin individually
- Flexible pin configuration through dedicated Pin Configuration Register
- . Synchronous and/or asynchronous input sensing with port interrupts and events
  - Sense both edges
  - Sense rising edges
  - Sense falling edges
  - Sense low level
- . Asynchronous wake-up from all input sensing configurations
- · Two port interrupts with flexible pin masking
- . Highly configurable output driver and pull settings:
  - Totem-pole
  - Pull-up/-down
  - Wired-AND
  - Wired-OR
  - Bus-keeper
  - Inverted I/O
- Optional Slew rate control
- . Configuration of multiple pins in a single operation
- Read-Modify-Write (RMW) support
- Toggle/clear/set registers for Output and Direction registers
- Clock output on port pin
- Event Channel 7 output on port pin
- . Mapping of port registers (virtual ports) into bit accessible I/O memory space

# 14.2 Overview

The XMEGA A1 devices have flexible General Purpose I/O Ports. A port consists of up to 8 pins, ranging from pin 0 to pin 7. The ports implement several functions, including synchronous/asynchronous input sensing, pin change interrupts and configurable output settings. All functions are individual per pin, but several pins may be configured in a single operation.

# 14.3 I/O configuration

All port pins (Pn) have programmable output configuration. In addition, all port pins have an inverted I/O function. For an input, this means inverting the signal between the port pin and the pin register. For an output, this means inverting the output signal between the port register and the port pin. The inverted I/O function can be used also when the pin is used for alternate functions. The port pins also have configurable slew rate limitation to reduce electromagnetic emission.

# 14.3.1 Push-pull

Figure 14-1. I/O configuration - Totem-pole

# 14.3.2 Pull-down

Figure 14-2. I/O configuration - Totem-pole with pull-down (on input)

# 14.3.3 Pull-up

Figure 14-3. I/O configuration - Totem-pole with pull-up (on input)

# 14.3.4 Bus-keeper

The bus-keeper's weak output produces the same logical level as the last output level. It acts as a pull-up if the last level was '1', and pull-down if the last level was '0'.

Figure 14-4. I/O configuration - Totem-pole with bus-keeper

# 14.3.5 Others

Figure 14-5. Output configuration - Wired-OR with optional pull-down

Figure 14-6. I/O configuration - Wired-AND with optional pull-up

# 14.4 Input sensing

- · Sense both edges
- Sense rising edges
- Sense falling edges
- Sense low level

Input sensing is synchronous or asynchronous depending on the enabled clock for the ports, and the configuration is shown in Figure 14-7 on page 30.

Figure 14-7. Input sensing system overview

When a pin is configured with inverted I/O the pin value is inverted before the input sensing.

# 14.5 Port Interrupt

Each ports have two interrupts with seperate priority and interrupt vector. All pins on the port can be individually selected as source for each of the interrupts. The interrupts are then triggered according to the input sense configuration for each pin configured as source for the interrupt.

# 14.6 Alternate Port Functions

In addition to the input/output functions on all port pins, most pins have alternate functions. This means that other modules or peripherals connected to the port can use the port pins for their functions, such as communication or pulse-width modulation. "Pinout and Pin Functions" on page 49 shows which modules on peripherals that enables alternate functions on a pin, and what alternate functions that is available on a pin.

# 15. T/C - 16-bit Timer/Counter

## 15.1 Features

- Eight 16-bit Timer/Counters
  - Four Timer/Counters of type 0
  - Four Timer/Counters of type 1
- Four Compare or Capture (CC) Channels in Timer/Counter 0
- Two Compare or Capture (CC) Channels in Timer/Counter 1
- Double Buffered Timer Period Setting
- Double Buffered Compare or Capture Channels
- Waveform Generation:
  - Single Slope Pulse Width Modulation
  - Dual Slope Pulse Width Modulation
  - Frequency Generation
- Input Capture:
  - Input Capture with Noise Cancelling
  - Frequency capture
  - Pulse width capture
  - 32-bit input capture
- Event Counter with Direction Control
- Timer Overflow and Timer Error Interrupts and Events
- One Compare Match or Capture Interrupt and Event per CC Channel
- Supports DMA Operation
- Hi-Resolution Extension (Hi-Res)
- Advanced Waveform Extension (AWEX)

## 15.2 Overview

XMEGA A1 has eight Timer/Counters, four Timer/Counter 0 and four Timer/Counter 1. The difference between them is that Timer/Counter 0 has four Compare/Capture channels, while Timer/Counter 1 has two Compare/Capture channels.

The Timer/Counters (T/C) are 16-bit and can count any clock, event or external input in the microcontroller. A programmable prescaler is available to get a useful T/C resolution. Updates of Timer and Compare registers are double buffered to ensure glitch free operation. Single slope PWM, dual slope PWM and frequency generation waveforms can be generated using the Compare Channels.

Through the Event System, any input pin or event in the microcontroller can be used to trigger input capture, hence no dedicated pins is required for this. The input capture has a noise canceller to avoid incorrect capture of the T/C, and can be used to do frequency and pulse width measurements.

A wide range of interrupt or event sources are available, including T/C Overflow, Compare match and Capture for each Compare/Capture channel in the T/C.

PORTC, PORTD, PORTE and PORTF each has one Timer/Counter 0 and one Timer/Counter1. Notation of these Timer/Counters are TCC0 (Time/Counter C0), TCC1, TCD0, TCD1, TCE0, TCE1, TCF0, and TCF1, respectively.

Figure 15-1. Overview of a Timer/Counter and closely related peripherals

The Hi-Resolution Extension can be enabled to increase the waveform generation resolution by 2 bits (4x). This is available for all Timer/Counters. See "Hi-Res - High Resolution Extension" on page 34 for more details.

The Advanced Waveform Extension can be enabled to provide extra and more advanced features for the Timer/Counter. This are only available for Timer/Counter 0. See "AWEX - Advanced Waveform Extension" on page 33 for more details.

# 16. AWEX - Advanced Waveform Extension

# 16.1 Features

- Output with complementary output from each Capture channel
- Four Dead Time Insertion (DTI) Units, one for each Capture channel
- 8-bit DTI Resolution
- Separate High and Low Side Dead-Time Setting
- Double Buffered Dead-Time
- Event Controlled Fault Protection
- Single Channel Multiple Output Operation (for BLDC motor control)
- Double Buffered Pattern Generation

# 16.2 Overview

The Advanced Waveform Extension (AWEX) provides extra features to the Timer/Counter in Waveform Generation (WG) modes. The AWEX enables easy and safe implementation of for example, advanced motor control (AC, BLDC, SR, and Stepper) and power control applications.

Any WG output from a Timer/Counter 0 is split into a complimentary pair of outputs when any AWEX feature is enabled. These output pairs go through a Dead-Time Insertion (DTI) unit that enables generation of the non-inverted Low Side (LS) and inverted High Side (HS) of the WG output with dead time insertion between LS and HS switching. The DTI output will override the normal port value according to the port override setting. Optionally the final output can be inverted by using the invert I/O setting for the port pin.

The Pattern Generation unit can be used to generate a synchronized bit pattern on the port it is connected to. In addition, the waveform generator output from Compare Channel A can be distributed to, and override all port pins. When the Pattern Generator unit is enabled, the DTI unit is bypassed.

The Fault Protection unit is connected to the Event System. This enables any event to trigger a fault condition that will disable the AWEX output. Several event channels can be used to trigger fault on several different conditions.

The AWEX is available for TCC0 and TCE0. The notation of these peripherals are AWEXC and AWEXE.

# 17. Hi-Res - High Resolution Extension

# 17.1 Features

- Increases Waveform Generator resolution by 2-bits (4x)
- Supports Frequency, single- and dual-slope PWM operation
- Supports the AWEX when this is enabled and used for the same Timer/Counter

# 17.2 Overview

The Hi-Resolution (Hi-Res) Extension is able to increase the resolution of the waveform generation output by a factor of 4. When enabled for a Timer/Counter, the Fast Peripheral clock running at four times the CPU clock speed will be as input to the Timer/Counter.

The High Resolution Extension can also be used when an AWEX is enabled and used with a Timer/Counter.

XMEGA A1 devices have four Hi-Res Extensions that each can be enabled for each Timer/Counters pair on PORTC, PORTD, PORTE and PORTF. The notation of these peripherals are HIRESC, HIRESD, HIRESE and HIRESF, respectively.

# 18. RTC - 16-bit Real-Time Counter

## 18.1 Features

- 16-bit Timer
- Flexible Tick resolution ranging from 1 Hz to 32.768 kHz
- One Compare register
- One Period register
- Clear timer on Overflow or Compare Match
- Overflow or Compare Match event and interrupt generation

## 18.2 Overview

The XMEGA A1 includes a 16-bit Real-time Counter (RTC). The RTC can be clocked from an accurate 32.768 kHz Crystal Oscillator, the 32.768 kHz Calibrated Internal Oscillator, or from the 32 kHz Ultra Low Power Internal Oscillator. The RTC includes both a Period and a Compare register. For details, see Figure 18-1.

A wide range of Resolution and Time-out periods can be configured using the RTC. With a maximum resolution of 30.5  $\mu$ s, time-out periods range up to 2000 seconds. With a resolution of 1 second, the maximum time-out period is over 18 hours (65536 seconds).

Figure 18-1. Real Time Counter overview

# 19. TWI - Two-Wire Interface

## 19.1 Features

- Four Identical TWI peripherals
- Simple yet Powerful and Flexible Communication Interface
- Both Master and Slave Operation Supported
- Device can Operate as Transmitter or Receiver
- 7-bit Address Space Allows up to 128 Different Slave Addresses
- Multi-master Arbitration Support
- Up to 400 kHz Data Transfer Speed
- Slew-rate Limited Output Drivers
- Noise Suppression Circuitry Rejects Spikes on Bus Lines
- Fully Programmable Slave Address with General Call Support
- Address Recognition Causes Wake-up when in Sleep Mode
- I<sup>2</sup>C and System Management Bus (SMBus) compatible

# 19.2 Overview

The Two-Wire Interface (TWI) is a bi-directional wired-AND bus with only two lines, the clock (SCL) line and the data (SDA) line. The protocol makes it possible to interconnect up to 128 individually addressable devices. Since it is a multi-master bus, one or more devices capable of taking control of the bus can be connected.

The only external hardware needed to implement the bus is a single pull-up resistor for each of the TWI bus lines. Mechanisms for resolving bus contention are inherent in the TWI protocol.

PORTC, PORTD, PORTE, and PORTF each has one TWI. Notation of these peripherals are TWIC, TWID, TWIE, and TWIF, respectively.

# 20. SPI - Serial Peripheral Interface

#### 20.1 Features

- Four Identical SPI peripherals
- Full-duplex, Three-wire Synchronous Data Transfer
- Master or Slave Operation
- LSB First or MSB First Data Transfer
- Seven Programmable Bit Rates
- End of Transmission Interrupt Flag
- Write Collision Flag Protection
- Wake-up from Idle Mode
- Double Speed (CK/2) Master SPI Mode

#### 20.2 Overview

The Serial Peripheral Interface (SPI) allows high-speed full-duplex, synchronous data transfer between different devices. Devices can communicate using a master-slave scheme, and data is transferred both to and from the devices simultaneously.

PORTC, PORTD, PORTE, and PORTF each has one SPI. Notation of these peripherals are SPIC, SPID, SPIE, and SPIF, respectively.

### **21. USART**

#### 21.1 Features

- Eight Identical USART peripherals
- Full Duplex Operation (Independent Serial Receive and Transmit Registers)
- Asynchronous or Synchronous Operation
- Master or Slave Clocked Synchronous Operation
- High-resolution Arithmetic Baud Rate Generator
- Supports Serial Frames with 5, 6, 7, 8, or 9 Data Bits and 1 or 2 Stop Bits
- Odd or Even Parity Generation and Parity Check Supported by Hardware
- Data OverRun Detection
- Framing Error Detection
- . Noise Filtering Includes False Start Bit Detection and Digital Low Pass Filter
- Three Separate Interrupts on TX Complete, TX Data Register Empty and RX Complete
- Multi-processor Communication Mode
- Double Speed Asynchronous Communication Mode
- . Master SPI mode for SPI communication
- · IrDA support through the IRCOM module

#### 21.2 Overview

The Universal Synchronous and Asynchronous serial Receiver and Transmitter (USART) is a highly flexible serial communication module. The USART supports full duplex communication, and both asynchronous and clocked synchronous operation. The USART can also be set in Master SPI mode to be used for SPI communication.

Communication is frame based, and the frame format can be customized to support a wide range of standards. The USART is buffered in both direction, enabling continued data transmission without any delay between frames. There are separate interrupt vectors for receive and transmit complete, enabling fully interrupt driven communication. Frame error and buffer overflow are detected in hardware and indicated with separate status flags. Even or odd parity generation and parity check can also be enabled.

One USART can use the IRCOM module to support IrDA 1.4 physical compliant pulse modulation and demodulation for baud rates up to 115.2 kbps.

PORTC, PORTD, PORTE, and PORTF each has two USARTs. Notation of these peripherals are USARTC0, USARTC1, USARTD0, USARTD1, USARTE0, USARTE1, USARTF0, USARTF1, respectively.

# 22. IRCOM - IR Communication Module

#### 22.1 Features

- Pulse modulation/demodulation for infrared communication
- Compatible to IrDA 1.4 physical for baud rates up to 115.2 kbps
- Selectable pulse modulation scheme
  - 3/16 of baud rate period
  - Fixed pulse period, 8-bit programmable
  - Pulse modulation disabled
- · Built in filtering
- · Can be connected to and used by one USART at a time

#### 22.2 Overview

XMEGA contains an Infrared Communication Module (IRCOM) for IrDA communication with baud rates up to 115.2 kbps. This supports three modulation schemes: 3/16 of baud rate period, fixed programmable pulse time based on the Peripheral Clock speed, or pulse modulation disabled. There is one IRCOM available which can be connected to any USART to enable infrared pulse coding/decoding for that USART.

# 23. Crypto Engine

#### 23.1 Features

- Data Encryption Standard (DES) CPU instruction
- Advanced Encryption Standard (AES) Crypto module
- DES Instruction
  - Encryption and Decryption
  - Single-cycle DES instruction
  - Encryption/Decryption in 16 clock cycles per 8-byte block
- AES Crypto Module
  - Encryption and Decryption
  - Support 128-bit keys
  - Support XOR data load mode to the State memory for Cipher Block Chaining
  - Encryption/Decryption in 375 clock cycles per 16-byte block

#### 23.2 Overview

The Advanced Encryption Standard (AES) and Data Encryption Standard (DES) are two commonly used encryption standards. These are supported through an AES peripheral module and a DES CPU instruction. All communication interfaces and the CPU can optionally use AES and DES encrypted communication and data storage.

DES is supported by a DES instruction in the AVR XMEGA CPU. The 8-byte key and 8-byte data blocks must be loaded into the Register file, and then DES must be executed 16 times to encrypt/decrypt the data block.

The AES Crypto Module encrypts and decrypts 128-bit data blocks with the use of a 128-bit key. The key and data must be loaded into the key and state memory in the module before encryption/decryption is started. It takes 375 peripheral clock cycles before the encryption/decryption is done and decrypted/encrypted data can be read out, and an optional interrupt can be generated. The AES Crypto Module also has DMA support with transfer triggers when encryption/decryption is done and optional auto-start of encryption/decryption when the state memory is fully loaded.

# 24. ADC - 12-bit Analog to Digital Converter

#### 24.1 Features

- Two ADCs with 12-bit resolution
- 2 Msps sample rate for each ADC
- Signed and Unsigned conversions
- 4 result registers with individual input channel control for each ADC
- 8 single ended inputs for each ADC
- 8x4 differential inputs for each ADC
- · 4 internal inputs:
  - Integrated Temperature Sensor
  - DAC Output
  - VCC voltage divided by 10
  - Bandgap voltage
- Software selectable gain of 2, 4, 8, 16, 32 or 64
- Software selectable resolution of 8- or 12-bit.
- Internal or External Reference selection
- Event triggered conversion for accurate timing
- DMA transfer of conversion results
- Interrupt/Event on compare result

#### 24.2 Overview

XMEGA A1 devices have two Analog to Digital Converters (ADC), see Figure 24-1 on page 42. The two ADC modules can be operated simultaneously, individually or synchronized.

The ADC converts analog voltages to digital values. The ADC has 12-bit resolution and is capable of converting up to 2 million samples per second. The input selection is flexible, and both single-ended and differential measurements can be done. For differential measurements an optional gain stage is available to increase the dynamic range. In addition several internal signal inputs are available. The ADC can provide both signed and unsigned results.

This is a pipeline ADC. A pipeline ADC consists of several consecutive stages, where each stage convert one part of the result. The pipeline design enables high sample rate at low clock speeds, and remove limitations on samples speed versus propagation delay. This also means that a new analog voltage can be sampled and a new ADC measurement started while other ADC measurements are ongoing.

ADC measurements can either be started by application software or an incoming event from another peripheral in the device. Four different result registers with individual input selection (MUX selection) are provided to make it easier for the application to keep track of the data. Each result register and MUX selection pair is referred to as an ADC Channel. It is possible to use DMA to move ADC results directly to memory or peripherals when conversions are done.

Both internal and external analog reference voltages can be used. An accurate internal 1.0V reference is available.

An integrated temperature sensor is available and the output from this can be measured with the ADC. The output from the DAC, VCC/10 and the Bandgap voltage can also be measured by the ADC.

Figure 24-1. ADC overview

Each ADC has four MUX selection registers with a corresponding result register. This means that four channels can be sampled within 1.5 µs without any intervention by the application other than starting the conversion. The results will be available in the result registers.

The ADC may be configured for 8- or 12-bit result, reducing the minimum conversion time (propagation delay) from 3.5  $\mu$ s for 12-bit to 2.5  $\mu$ s for 8-bit result.

ADC conversion results are provided left- or right adjusted with optional '1' or '0' padding. This eases calculation when the result is represented as a signed integer (signed 16-bit number).

PORTA and PORTB each has one ADC. Notation of these peripherals are ADCA and ADCB, respectively.

# 25. DAC - 12-bit Digital to Analog Converter

#### 25.1 Features

- Two DACs with 12-bit resolution
- Up to 1 Msps conversion rate for each DAC
- Flexible conversion range
- Multiple trigger sources
- 1 continuous output or 2 Sample and Hold (S/H) outputs for each DAC
- · Built-in offset and gain calibration
- · High drive capabilities
- Low Power Mode

#### 25.2 Overview

The XMEGA A1 devices features two 12-bit, 1 Msps DACs with built-in offset and gain calibration, see Figure 25-1 on page 43.

A DAC converts a digital value into an analog signal. The DAC may use an internal 1.1 voltage as the upper limit for conversion, but it is also possible to use the supply voltage or any applied voltage in-between. The external reference input is shared with the ADC reference input.

Figure 25-1. DAC overview

Each DAC has one continuous output with high drive capabilities for both resistive and capacitive loads. It is also possible to split the continuous time channel into two Sample and Hold (S/H) channels, each with separate data conversion registers.

A DAC conversion may be started from the application software by writing the data conversion registers. The DAC can also be configured to do conversions triggered by the Event System to have regular timing, independent of the application software. DMA may be used for transferring data from memory locations to DAC data registers.

The DAC has a built-in calibration system to reduce offset and gain error when loading with a calibration value from software.

PORTA and PORTB each has one DAC. Notation of these peripherals are DACA and DACB. respectively.

# 26. AC - Analog Comparator

#### 26.1 Features

- Four Analog Comparators
- Selectable Power vs. Speed
- · Selectable hysteresis
  - 0, 20 mV, 50 mV
- Analog Comparator output available on pin
- Flexible Input Selection
  - All pins on the port
  - Output from the DAC
  - Bandgap reference voltage.
  - Voltage scaler that can perform a 64-level scaling of the internal VCC voltage.
- Interrupt and event generation on
  - Rising edge
  - Falling edge
  - Toggle
- Window function interrupt and event generation on
  - Signal above window
  - Signal inside window
  - Signal below window

#### 26.2 Overview

XMEGA A1 features four Analog Comparators (AC). An Analog Comparator compares two voltages, and the output indicates which input is largest. The Analog Comparator may be configured to give interrupt requests and/or events upon several different combinations of input change.

Both hysteresis and propagation delays may be adjusted in order to find the optimal operation for each application.

A wide range of input selection is available, both external pins and several internal signals can be used.

The Analog Comparators are always grouped in pairs (AC0 and AC1) on each analog port. They have identical behavior but separate control registers.

Optionally, the state of the comparator is directly available on a pin.

PORTA and PORTB each has one AC pair. Notations are ACA and ACB, respectively.

Figure 26-1. Analog comparator overview

# 26.3 Input Selection

The Analog comparators have a very flexible input selection and the two comparators grouped in a pair may be used to realize a window function. One pair of analog comparators is shown in Figure 26-1 on page 45.

- Input selection from pin
  - Pin 0, 1, 2, 3, 4, 5, 6 selectable to positive input of analog comparator
  - Pin 0, 1, 3, 5, 7 selectable to negative input of analog comparator
- Internal signals available on positive analog comparator inputs
  - Output from 12-bit DAC
- Internal signals available on negative analog comparator inputs
  - 64-level scaler of the VCC, available on negative analog comparator input
  - Bandgap voltage reference
  - Output from 12-bit DAC

#### 26.4 Window Function

The window function is realized by connecting the external inputs of the two analog comparators in a pair as shown in Figure 26-2.

Figure 26-2. Analog comparator window function

# 27. OCD - On-chip Debug

#### 27.1 Features

- Complete Program Flow Control
  - Go, Stop, Reset, Step into, Step over, Step out, Run-to-Cursor
- Debugging on C and high-level language source code level
- Debugging on Assembler and disassembler level
- · 1 dedicated program address or source level breakpoint for AVR Studio / debugger
- 4 Hardware Breakpoints
- Unlimited Number of User Program Breakpoints
- Unlimited Number of User Data Breakpoints, with break on:
  - Data location read, write or both read and write
  - Data location content equal or not equal to a value
  - Data location content is greater or less than a value
  - Data location content is within or outside a range
  - Bits of a data location are equal or not equal to a value
- Non-Intrusive Operation
  - No hardware or software resources in the device are used
- High Speed Operation
  - No limitation on debug/programming clock frequency versus system clock frequency

#### 27.2 Overview

The XMEGA A1 has a powerful On-Chip Debug (OCD) system that - in combination with Atmel's development tools - provides all the necessary functions to debug an application. It has support for program and data breakpoints, and can debug an application from C and high level language source code level, as well as assembler and disassembler level. It has full Non-Intrusive Operation and no hardware or software resources in the device are used. The ODC system is accessed through an external debugging tool which connects to the JTAG or PDI physical interfaces. Refer to "PDI - Program and Debug Interface" on page 48.

# 28. PDI - Program and Debug Interface

#### 28.1 Features

- PDI Program and Debug Interface (Atmel proprietary 2-pin interface)
- JTAG Interface (IEEE std. 1149.1 compliant)
- Boundary-scan capabilities according to the IEEE Std. 1149.1 (JTAG)
- · Access to the OCD system
- . Programming of Flash, EEPROM, Fuses and Lock Bits

#### 28.2 Overview

The programming and debug facilities are accessed through the JTAG and PDI physical interfaces. The PDI physical interface uses one dedicated pin together with the Reset pin, and no general purpose pins are used. JTAG uses four general purpose pins on PORTB.

The PDI is an Atmel proprietary protocol for communication between the microcontroller and Atmel's or third party development tools.

### 28.3 JTAG interface

The JTAG physical layer handles the basic low-level serial communication over four I/O lines named TMS, TCK, TDI, and TDO. It complies to the IEEE Std. 1149.1 for test access port and boundary scan.

### 29. Pinout and Pin Functions

The pinout of XMEGA A1 is shown in "Pinout/Block Diagram" on page 3. In addition to general I/O functionality, each pin may have several functions. This will depend on which peripheral is enabled and connected to the actual pin. Only one of the alternate pin functions can be used at time.

# 29.1 Alternate Pin Function Description

The tables below shows the notation for all pin functions available and describes its function.

#### 29.1.1 Operation/Power Supply

VCC Digital supply voltage
AVCC Analog supply voltage

GND Ground

#### 29.1.2 Port Interrupt functions

SYNC Port pin with full synchronous and limited asynchronous interrupt function
ASYNC Port pin with full synchronous and full asynchronous interrupt function

#### 29.1.3 Analog functions

ACn Analog Comparator input pin n

ACOOUT Analog Comparator 0 Output

ADCn Analog to Digital Converter input pin n

DACn Digital to Analog Converter output pin n

AREF Analog Reference input pin

#### 29.1.4 EBI functions

An Address line n

Dn Data line n

CSn Chip Select n

ALEn Address Latch Enable pin n (SRAM)  $\overline{\text{RE}}$  Read Enable (SRAM)

WE External Data Memory Write (SRAM /SDRAM)

BAn Bank Address (SDRAM) CAS Column Access Strobe (SDRAM) CKE SDRAM Clock Enable (SDRAM) CLK SDRAM Clock (SDRAM) DQM Data Mask Signal/Output Enable (SDRAM) RAS Row Access Strobe (SDRAM)

#### 29.1.5 Timer/Counter and AWEX functions

OCnx Output Compare Channel x for Timer/Counter n

OCxn Inverted Output Compare Channel x for Timer/Counter n

#### 29.1.6 Communication functions

SCL Serial Clock for TWI SDA Serial Data for TWI

SCLIN Serial Clock In for TWI when external driver interface is enabled SCLOUT Serial Clock Out for TWI when external driver interface is enabled SDAIN Serial Data In for TWI when external driver interface is enabled SDAOUT Serial Data Out for TWI when external driver interface is enabled

XCKn Transfer Clock for USART n

RXDn Receiver Data for USART n

TXDn Transmitter Data for USART n

Slave Select for SPI

MOSI Master Out Slave In for SPI
MISO Master In Slave Out for SPI

SCK Serial Clock for SPI

#### 29.1.7 Oscillators, Clock and Event

TOSCn Timer Oscillator pin n

XTALn Input/Output for inverting Oscillator pin n

CLKOUT Peripheral Clock Output
EVOUT Event Channel 0 Output

#### 29.1.8 Debug/System functions

RESET Reset pin

PDI\_CLK Program and Debug Interface Clock pin
PDI\_DATA Program and Debug Interface Data pin

TCK JTAG Test Clock

TDI JTAG Test Data In

TDO JTAG Test Data Out

TMS JTAG Test Mode Select

### 29.2 Alternate Pin Functions

The tables below show the primary/default function for each pin on a port in the first column, the pin number in the second column, and then all alternate pin functions in the remaining columns. The head row shows what peripheral that enable and use the alternate pin functions.

**Table 29-1.** Port A - Alternate functions

| PORT A | PIN# | INTERRUPT  | ADCA<br>POS | ADCA<br>NEG | ADCA<br>GAINPOS | ADCA<br>GAINNEG | ACA<br>POS | ACA<br>NEG | ACA<br>OUT | DACA | REFA |

# 30. Peripheral Module Address Map

The address maps show the base address for each peripheral and module in XMEGA A1. For complete register description and summary for each peripheral module, refer to the XMEGA A Manual.

| Base Address     | Name      | Description                                  |
|------------------|-----------|----------------------------------------------|
| 0x0000           | GPIO      | General Purpose IO Registers                 |
| 0x0010           | VPORT0    | Virtual Port 0                               |
| 0x0014           | VPORT1    | Virtual Port 1                               |
| 0x0018           | VPORT2    | Virtual Port 2                               |
| 0x001C           | VPORT3    | Virtual Port 3                               |
| 0x0030           | CPU       | CPU                                          |
| 0x0040           | CLK       | Clock Control                                |
| 0x0048           | SLEEP     | Sleep Controller                             |
| 0x0050           | OSC       | Oscillator Control                           |
| 0x0060           | DFLLRC32M | DFLL for the 32 MHz Internal RC Oscillator   |
| 0x0068           | DFLLRC2M  | DFLL for the 2 MHz RC Oscillator             |
| 0x0070           | PR        | Power Reduction                              |

Notes: 1. Cycle times for Data memory accesses assume internal memory accesses, and are not valid for accesses via the external RAM interface.

2. One extra cycle must be added when accessing Internal SRAM.

Notes

- 1. This package conforms to JEDEC reference MS-026, Variation AED.
- Dimensions D1 and E1 do not include mold protrusion. Allowable protrusion is 0.25 mm per side. Dimensions D1 and E1 are maximum plastic body size dimensions including mold mismatch.
- 3. Lead coplanarity is 0.08 mm maximum.

\*NOTICE:

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 33-1. Current Consumption (Continued)

| Symbol | Parameter     | Condition                    | Min. | Тур. | Max. | Units |
|--------|---------------|------------------------------|------|------|------|-------|
|        | AC High-speed |                              |      | 220  |      |       |
|        | AC Low-power  |                              |      | 110  |      |       |
| ١,     | USART         | Rx and Tx enabled, 9600 BAUD |      | 7.5  |      |       |
| Icc    | DMA           | 1 MBps data rate             |      | 180  |      | μA    |
|        | Timer/Counter | Prescaler DIV1               |      | 18   |      |       |
|        | AES           |                              |      | 195  |      |       |

Note:

- 1. All Power Reduction Registers set. T = 25°C if not specified.
- 2. All parameters measured as the difference in current consumption between module enabled and disabled. All data at  $V_{CC} = 3.0V$ ,  $Clk_{SYS} = 1$  MHz External clock with no prescaling,  $T = 25^{\circ}C$ .

### 33.3 Speed

Table 33-2. Speed

| Symbol             | Parameter              | Condition              | Min | Тур | Max | Units |
|--------------------|------------------------|------------------------|-----|-----|-----|-------|
| Clk <sub>SYS</sub> |                        | V <sub>CC</sub> = 1.6V | 0   |     | 12  |       |
|                    | System clock frequency | V <sub>CC</sub> = 1.8V | 0   |     | 12  | MHz   |
|                    |                        | V <sub>CC</sub> = 2.7V | 0   |     | 32  |       |
|                    |                        | V <sub>CC</sub> = 3.6V | 0   |     | 32  |       |

The maximum System clock frequency of the XMEGA A1 devices is depending on  $V_{CC}$ . As shown in Figure 33-1 on page 66 the Frequency vs.  $V_{CC}$  curve is linear between  $1.8V < V_{CC} < 2.7V$ .

# 35. Errata

# 35.1 ATxmega128A1 rev. H

- . Bandgap voltage input for the ACs cannot be changed when used for both ACs simultaneously
- DAC is nonlinear and inaccurate when reference is above 2.4V or V<sub>CC</sub> 0.6V
- . ADC gain stage output range is limited to 2.4V
- The ADC has up to ±2 LSB inaccuracy
- TWI, a general address call will match independent of the R/W-bit value
- TWI, the minimum I<sup>2</sup>C SCL low time could be violated in Master Read mode
- TWI, the address-mask features is missing
- Setting HIRES PR bit makes PWM output unavailable
- · BOD will be enabled after any reset
- Propagation delay analog Comparator increasing to 2 ms at -40°C
- Sampled BOD in Active mode will cause noise when bandgap is used as reference
- . Default setting for SDRAM refresh period too low
- Flash Power Reduction Mode can not be enabled when entering sleep mode
- JTAG enable does not override Analog Comparator B output
- ullet Bandgap measurement with the ADC is non-functional when  $V_{CC}$  is below 2.7V
- DAC refresh may be blocked in S/H mode

# 1. Bandgap voltage input for the ACs cannot be changed when used for both ACs simultaneously

If the bandgap voltage is selected as input for one Analog Comparator (AC) and then selected/deselected as input for the another AC, the first comparator will be affected for up to 1 us and could potentially give a wrong comparison result.

# Problem fix/Workaround

If the Bandgap is required for both ACs simultaneously, configure the input selection for both ACs before enabling any of them.

#### 2. DAC is nonlinear and inaccurate when reference is above 2.4V or Vcc-0.6V

Using the DAC with a reference voltage above 2.4V or Vcc-0.6Vgive inaccurate output when converting codes that give below 0.75V output:

- ±10 LSB for continuous mode
- ±20 LSB for Sample and Hold mode

#### Problem fix/Workaround

None, avoid using a voltage reference above 2.4V or Vcc-0.6V

## 3. ADC gain stage output range is limited to 2.4 V

The amplified output of the ADC gain stage will never go above 2.4 V, hence the differential input will only give correct output when below 2.4 V/gain. For the available gain settings, this gives a differential input range of

1x gain: 2.4 V
 2x gain: 1.2 V
 4x gain: 0.6 V

300 8x gain: mV 16x gain: 150 mV 32x gain: 75 mV 64x 38 mV gain:

#### Problem fix/Workaround

Keep the amplified voltage output from the ADC gain stage below 2.4 V in order to get a correct result, or keep ADC voltage reference below 2.4 V.

# 4. The ADC has up to ±2 LSB inaccuracy

The ADC will have up to ±2 LSB inaccuracy, visible as a saw-tooth pattern on the input voltage/ output value transfer function of the ADC. The inaccuracy increases with increasing voltage reference reaching ±2 LSB with 3V reference.

## Problem fix/Workaround

None, the actual ADC resolution will be reduced with up to ±2 LSB.

# 5. TWI, a general address call will match independent of the R/W-bit value.

When the TWI is in Slave mode and a general address call is issued on the bus, the TWI Slave will get an address match regardless of the R/W-bit (ADDR[0] bit) value in the Slave Address Register.

#### Problem fix/Workaround

Use software to check the R/W-bit on general call address match.

#### 6. TWI, the minimum I2C SCL low time could be violated in Master Read mode

When the TWI is in Master Read mode and issuing a Repeated Start on the bus, this will immediately release the SCL line even if one complete SCL low period has not passed. This means that the minimum SCL low time in the I2C specification could be violated.

#### Problem fix/Workaround

If this causes a potential problem in the application, software must ensure that the Repeated Start is never issued before one SCL low time has passed.

#### 7. TWI, the address-mask features is missing

The address-mask functionality is missing, so the TWI cannot perform address match on more than one address.

# Problem fix/Workaround

If the TWI must respond to multiple addresses, enable Promiscuous Mode for the TWI to respond to all address and implementing the address-mask function in software

## 8. Setting HIRES PR bit makes PWM output unavailable

Setting the HIRES Power Reduction (PR) bit for PORTx will make any Frequency or PWM output for the corresponding Timer/Counters (TCx0 and TCx1) unavailable on the pin even if the Hi-Res is not used.

#### Problem fix/Workaround

Do not write the HIRES PR bit on PORTx when frequency or PWM output from TCx0/1 is used.

# 9. BOD will be enabled after any reset

If any reset source goes active, the BOD will be enabled and keep the device in reset if the VCC voltage is below the programmed BOD level. During Power-On Reset, reset will not be released until VCC is above the programmed BOD level even if the BOD is disabled.

#### Problem fix/Workaround

Do not set the BOD level higher than VCC even if the BOD is not used.

# 10. Propagation delay analog Comparator increasing to 2 ms at -40 °C

When the analog comparator is used at temperatures reaching down to -40  $^{\circ}$ C, the propagation delay will increase to ~2 ms.

#### Problem fix/Workaround

None

# 11. Sampled BOD in Active mode will cause noise when bandgap is used as reference

Using the BOD in sampled mode when the device is running in Active or Idle mode will add noise on the bandgap reference for ADC and DAC.

#### Problem fix/Workaround

If the bandgap is used as reference for either the ADC or the DAC, the BOD must not be set in sampled mode.

## 12. Default setting for SDRAM refresh period too low

If the SDRAM refresh period is set to a value less then 0x20, the SDRAM content may be corrupted when accessing through On-Chip Debug sessions.

## Problem fix/Workaround

The SDRAM refresh period (REFRESHH/L) should not be set to a value less then 0x20.

# 13. Flash Power Reduction Mode can not be enabled when entering sleep mode

If Flash Power Reduction Mode is enabled when entering Power-save or Extended Standby sleep mode, the device will only wake up on every fourth wake-up request.

If Flash Power Reduction Mode is enabled when entering Idle sleep mode, the wake-up time will vary with up to 16 CPU clock cycles.

#### Problem fix/Workaround

Disable Flash Power Reduction mode before entering sleep mode.

## 14. JTAG enable does not override Analog Comparator B output

When JTAG is enabled this will not override the Anlog Comparator B (ACB)ouput, AC0OUT on pin 7 if this is enabled.

#### Problem fix/Workaround

ACOOUT for ACB should not be enabled when JTAG is used. Use only analog comparator output for ACA when JTAG is used, or use the PDI as debug interface.

## 15. Bandgap measurement with the ADC is non-functional when $V_{CC}$ is below 2.7V

The ADC cannot be used to do bandgap measurements when  $V_{CC}$  is below 2.7V.

#### Problem fix/Workaround

If internal voltages must be measured when  $V_{CC}$  is below 2.7V, measure the internal 1.00V reference instead of the bandgap.

# 16. DAC refresh may be blocked in S/H mode

If the DAC is running in Sample and Hold (S/H) mode and conversion for one channel is done at maximum rate (i.e. the DAC is always busy doing conversion for this channel), this will block refresh signals to the second channel.

## Problem fix/Workarund

When using the DAC in S/H mode, ensure that none of the channels is running at maximum conversion rate, or ensure that the conversion rate of both channels is high enough to not require refresh.

# 35.2 ATxmega128A1 rev. G

- Bootloader Section in Flash is non-functional
- Bandgap voltage input for the ACs cannot be changed when used for both ACs simultaneously
- DAC is nonlinear and inaccurate when reference is above 2.4V
- ADC gain stage output range is limited to 2.4 V
- The ADC has up to ±2 LSB inaccuracy
- TWI, a general address call will match independent of the R/W-bit value
- TWI, the minimum I<sup>2</sup>C SCL low time could be violated in Master Read mode
- Setting HIRES PR bit makes PWM output unavailable
- EEPROM erase and write does not work with all System Clock sources
- · BOD will be enabled after any reset
- Propagation delay analog Comparator increasing to 2 ms at -40°C
- · Sampled BOD in Active mode will cause noise when bandgap is used as reference
- . Default setting for SDRAM refresh period too low
- Flash Power Reduction Mode can not be enabled when entering sleep mode
- Enabling Analog Comparator B output will cause JTAG failure
- JTAG enable does not override Analog Comparator B output
- Bandgap measurement with the ADC is non-functional when V<sub>CC</sub> is below 2.7V
- · DAC refresh may be blocked in S/H mode

#### 1. Bootloader Section in Flash is non-functional

The Bootloader Section is non-functional, and bootloader or application code cannot reside in this part of the Flash.

## Problem fix/Workaround

None, do not use the Bootloader Section.

# 2. Bandgap voltage input for the ACs cannot be changed when used for both ACs simultaneously

If the Bandgap voltage is selected as input for one Analog Comparator (AC) and then selected/deselected as input for the another AC, the first comparator will be affected for up to 1 us and could potentially give a wrong comparison result.

#### Problem fix/Workaround

If the Bandgap is required for both ACs simultaneously, configure the input selection for both ACs before enabling any of them.

#### 3. DAC is nonlinear and inaccurate when reference is above 2.4V

Using the DAC with a reference voltage above 2.4V give inaccurate output when converting codes that give below 0.75V output:

- ±20 LSB for continuous mode
- ±200 LSB for Sample and Hold mode

#### Problem fix/Workaround

None, avoid using a voltage reference above 2.4V.

# 4. ADC gain stage output range is limited to 2.4 V

The amplified output of the ADC gain stage will never go above 2.4 V, hence the differential input will only give correct output when below 2.4 V/gain. For the available gain settings, this gives a differential input range of:

```
2.4 V
     gain:
 1x
 2x
              1.2 V
     gain:
 4x
              0.6 V
     gain:
 8x
     gain:
             300 mV
16x
     gain:
              150
                  mV
32x
              75
     gain:
                  mV
               38 mV
64x
     gain:
```

#### Problem fix/Workaround

Keep the amplified voltage output from the ADC gain stage below 2.4 V in order to get a correct result, or keep ADC voltage reference below 2.4 V.

# 5. The ADC has up to ±2 LSB inaccuracy

The ADC will have up to ±2 LSB inaccuracy, visible as a saw-tooth pattern on the input voltage/ output value transfer function of the ADC. The inaccuracy increases with increasing voltage reference reaching ±2 LSB with 3V reference.

#### Problem fix/Workaround

None, the actual ADC resolution will be reduced with up to ±2 LSB.

# 6. TWI, a general address call will match independent of the R/W-bit value

When the TWI is in Slave mode and a general address call is issued on the bus, the TWI Slave will get an address match regardless of the R/W-bit (ADDR[0] bit) value in the Slave Address Register.

#### Problem fix/Workaround

Use software to check the R/W-bit on general call address match.

# 7. TWI, the minimum I<sup>2</sup>C SCL low time could be violated in Master Read mode

When the TWI is in Master Read mode and issuing a Repeated Start on the bus, this will immediately release the SCL line even if one complete SCL low period has not passed. This means that the minimum SCL low time in the  $I^2C$  specification could be violated.

#### Problem fix/Workaround

If this causes a potential problem in the application, software must ensure that the Repeated Start is never issued before one SCL low time has passed.

# 8. Setting HIRES PR bit makes PWM output unavailable

Setting the HIRES Power Reduction (PR) bit for PORTx will make any Frequency or PWM output for the corresponding Timer/Counters (TCx0 and TCx1) unavailable on the pin.

# Problem fix/Workaround

Do not write the HIRES PR bit on PORTx when frequency or PWM output from TCx0/1 is used.

# 9. EEPROM erase and write does not work with all System Clock sources

When doing EEPROM erase or Write operations with other clock sources than the 2 MHz RCOSC, Flash will be read wrongly for one or two clock cycles at the end of the EEPROM operation.

#### Problem fix/Workaround

Alt 1: Use the internal 2 MHz RCOSC when doing erase or write operations on EEPROM.

Alt 2: Ensure to be in sleep mode while completing erase or write on EEPROM. After starting erase or write operations on EEPROM, other interrupts should be disabled and the device put to sleep.

# 10. BOD will be enabled after any reset

If any reset source goes active, the BOD will be enabled and keep the device in reset if the VCC voltage is below the programmed BOD level. During Power-On Reset, reset will not be released until VCC is above the programmed BOD level even if the BOD is disabled.

#### Problem fix/Workaround

Do not set the BOD level higher than VCC even if the BOD is not used.

# 11. Propagation delay analog Comparator increasing to 2 ms at -40 °C

When the analog comparator is used at temperatures reaching down to -40 °C, the propagation delay will increase to ~2 ms.

## Problem fix/Workaround

None

#### 12. Sampled BOD in Active mode will cause noise when bandgap is used as reference

Using the BOD in sampled mode when the device is running in Active or Idle mode will add noise on the bandgap reference for ADC and DAC.

#### Problem fix/Workaround

If the bandgap is used as reference for either the ADC or the DAC, the BOD must not be set in sampled mode.

## 13. Default setting for SDRAM refresh period too low

If the SDRAM refresh period is set to a value less then 0x20, the SDRAM content may be corrupted when accessing through On-Chip Debug sessions.

#### Problem fix/Workaround

The SDRAM refresh period (REFRESHH/L) should not be set to a value less then 0x20.

# 14. Flash Power Reduction Mode can not be enabled when entering sleep mode

If Flash Power Reduction Mode is enabled when entering Power-save or Extended Standby sleep mode, the device will only wake up on every fourth wake-up request.

If Flash Power Reduction Mode is enabled when entering Idle sleep mode, the wake-up time will vary with up to 16 CPU clock cycles.

#### Problem fix/Workaround

Disable Flash Power Reduction mode before entering sleep mode.

# 15. JTAG enable does not override Analog Comparator B output

When JTAG is enabled this will not override the Anlog Comparator B (ACB)ouput, ACOOUT on pin 7 if this is enabled.

#### Problem fix/Workaround

ACOOUT for ACB should not be enabled when JTAG is used. Use only analog comparator output for ACA when JTAG is used, or use the PDI as debug interface.

# 16. Bandgap measurement with the ADC is non-functional when $V_{cc}$ is below 2.7V

The ADC cannot be used to do bandgap measurements when  $V_{CC}$  is below 2.7V.

#### Problem fix/Workaround

If internal voltages must be measured when  $V_{CC}$  is below 2.7V, measure the internal 1.00V reference instead of the bandgap.

# 17. DAC refresh may be blocked in S/H mode

If the DAC is running in Sample and Hold (S/H) mode and conversion for one channel is done at maximum rate (i.e. the DAC is always busy doing conversion for this channel), this will block refresh signals to the second channel.

# Problem fix/Workarund

When using the DAC in S/H mode, ensure that none of the channels is running at maximum conversion rate, or ensure that the conversion rate of both channels is high enough to not require refresh.

# 36. Datasheet Revision History

# 36.1 8067I - 04/09

- 1. Updated "Ordering Information" on page 2.
- 2. Updated "PAD Characteristics" on page 69.

# 36.2 8067H - 04/09

- Editorial updates.
- 2. Updated "Overview" on page 48.
- 3. Updated Table 29-9 on page 54.
- 4. Updated "Peripheral Module Address Map" on page 55. IRCOM has address map: 0x08F8.
- 5. Updated "Electrical Characteristics" on page 64.
- 6. Updated "PAD Characteristics" on page 69.
- 7. Updated "Typical Characteristics" on page 71.

## 36.3 8067G - 11/08

- 1. Updated "Block Diagram" on page 6.
- 2. Updated feature list in "Memories" on page 10.
- 3. Updated "PDI Program and Debug Interface" on page 48.
- 4. Updated "Peripheral Module Address Map" on page 55. IRCOM has address 0x8F0.
- 5. Added "Electrical Characteristics" on page 64.
- 6. Added "Typical Characteristics" on page 71.
- 7. Added "ATxmega128A1 rev. H" on page 84.
- 8. Updated "ATxmega128A1 rev. G" on page 87.

# 36.4 8067F - 09/08

- 1. Updated "Features" on page 1
- 2. Updated "Ordering Information" on page 2
- 3. Updated Figure 7-1 on page 11 and Figure 7-2 on page 11.
- 4. Updated Table 7-2 on page 15.
- 5. Updated "Features" on page 41 and "Overview" on page 41.
- 6. Removed "Interrupt Vector Summary" section from datasheet.

# 36.5 8067E - 08/08

- 1. Changed Figure 2-1's title to "Block diagram and pinout" on page 3.
- 2. Updated Figure 2-2 on page 4.
- 3. Updated Table 29-2 on page 51 and Table 29-3 on page 52.

#### 36.6 8067D - 07/08

- 1. Updated "Ordering Information" on page 2.
- 2. Updated "Peripheral Module Address Map" on page 55.
- 3. Inserted "Interrupt Vector Summary" on page 56.

# 36.7 8067C - 06/08

- 1. Updated the Front page and "Features" on page 1.
- 2. Updated the "DC Characteristics" on page 64.
- 3. Updated Figure 3-1 on page 6.
- 4. Added "Flash and EEPROM Page Size" on page 15.
- 5. Updated Table 33-4 on page 67 with new data: Gain Error, Offset Error and Signal -to-Noise Ratio (SNR).
- 6. Updated Errata "ATxmega128A1 rev. G" on page 87.

## 36.8 8067B - 05/08

- 1. Updated "Pinout/Block Diagram" on page 3 and "Pinout and Pin Functions" on page 49.
- 2. Added XMEGA A1 Block Diagram, Figure 3-1 on page 6.
- 3. Updated "Overview" on page 5 included the XMEGA A1 explanation text on page 6.
- 4. Updated AVR CPU "Features" on page 8.
- 5. Updated Event System block diagram, Figure 9-1 on page 18.
- 6. Updated "PMIC Programmable Multi-level Interrupt Controller" on page 25.
- 7. Updated "AC Analog Comparator" on page 44.
- 8. Updated "Alternate Pin Function Description" on page 49.
- 9. Updated "Alternate Pin Functions" on page 51.
- 10. Updated "Typical Characteristics" on page 71.
- 11. Updated "Ordering Information" on page 2.
- 12. Updated "Overview" on page 5.

- 13. Updated Figure 6-1 on page 8.
- 14. Inserted a new Figure 15-1 on page 32.
- 15. Updated Speed grades in "Speed" on page 66.
- 16. Added a new ATxmega384A1 device in "Features" on page 1, updated "Ordering Information" on page 2 and "Memories" on page 10.
- 17. Replaced the Figure 3-1 on page 6 by a new XMEGA A1 detailed block diagram.
- 18. Inserted Errata "ATxmega128A1 rev. G" on page 87.

# 36.9 8067A - 02/08
