TDA7491P
10 W + 10 W dual BTL class-D audio amplifier

Features

- 10 W + 10 W continuous output power:
  $R_L = 6\ \Omega$, THD = 10% at $V_{CC} = 11$ V
- 9.5 W + 9.5 W continuous output power:
  $R_L = 8\ \Omega$, THD = 10% at $V_{CC} = 12$ V
- Wide range single supply operation (5 V - 18 V)
- High efficiency ($\eta = 90\%$)
- Four selectable, fixed gain settings of nominally 20 dB, 26 dB, 30 dB and 32 dB
- Differential inputs minimize common-mode noise
- Filterless operation
- No 'pop' at turn-on/off
- Standby and mute features
- Short-circuit protection
- Thermal overload protection
- Externally synchronizable

**PowerSSO-36 with
exposed pad down**

Description

The TDA7491P is a dual BTL class-D audio amplifier with single power supply designed for LCD TVs and monitors.

Thanks to the high efficiency and exposed-pad-down (EPD) package no separate heatsink is required.

Furthermore, the filterless operation allows a reduction in the external component count.

The TDA7491P is pin to pin compatible with the TDA7491LP and TDA7491HV.

Table 1.   Device summary

Order code	Operating temperature	Package	Packaging
TDA7491P	0 to 70 °C	PowerSSO-36 EPD	Tube
TDA7491P13TR	0 to 70 °C	PowerSSO-36 EPD	Tape and reel

ΔG_V	Gain matching	-	-1	-	1	dB
CT	Cross talk	f = 1 kHz	-	50	-	dB
eN	Total input noise	A Curve, G_V = 20 dB	-	20	-	µV
		f = 22 Hz to 22 kHz	-	25	35	
SVRR	Supply voltage rejection ratio	fr = 100 Hz, Vr = 0.5 V, C_{SVR} = 10 µF	40	50	-	dB
T_r, T_f	Rise and fall times	-	-	50	-	ns
f_{SW}	Switching frequency	Internal oscillator	290	310	330	kHz
f_{SWR}	Output switching frequency	With internal oscillator [1]	250	-	-	kHz
		With external oscillator [2]	250	-	-	
V_{inH}	Digital input high (H)	-	2.3	-	-	V
V_{inL}	Digital input low (L)		-	-	0.8	
A_{MUTE}	Mute attenuation	V_{MUTE} = 1 V	60	80	-	dB
Function mode	Standby, mute and play modes	$V_{STBY} < 0.5$ V, V_{MUTE} = X	Standby			-
		$V_{STBY} > 2.5$ V, $V_{MUTE} < 0.8$ V	Mute			-
		$V_{STBY} > 2.5$ V, $V_{MUTE} > 2.5$ V	Play			-

1. $f_{SW} = 10^6 / ((16 * R_{OSC} + 182) * 4)$ kHz, $f_{SYNCLK} = 2 * f_{SW}$ with R3 = 39 kΩ (see *Figure 49.*).

2. $f_{SW} = f_{SYNCLK} / 2$ with the frequency of the external oscillator.

4 Characterization curves

The following characterization curves were made using the TDA7491P demo board. The LC filter for the 4-Ω load uses components of 15 µH and 470 nF, whilst that for the 6-Ω load uses 22 µH and 220 nF and that for the 8-Ω load uses 33 µH and 220 nF.

All other test conditions are given along side the corresponding curves.

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: *www.st.com*. ECOPACK® is an ST trademark.

6 Applications circuit

Figure 49.   Applications circuit for class-D amplifier

TDA7491P

LC FILTER COMPONENT		
Load	L1,L2,L3,L4	C20,C26
4 ohm	15 uH	470 nF
6 ohm	22 uH	220 nF
8 ohm	33 uH	220 nF
16 ohm	68 uH	220 nF

Input settings for gain:

GAIN0 : GAIN1	Nominal gain
0 V : 0 V	20 dB
0 V : 3.3 V	26 dB
3.3 V : 0 V	30 dB
3.3 V : 3.3 V	32 dB

Input settings for standby, mute and play:

STBY : MUTE	Mode
0 V : 0 V	Standby
0 V : 3.3 V	Standby
3.3 V : 0 V	Mute
3.3 V : 3.3 V	Play

7 Applications information

7.1 Mode selection

The three operating modes of the TDA7491P are set by the two inputs STBY (pin 20) and MUTE (pin 21).

● Standby mode: all circuits are turned off, very low current consumption.

● Mute mode: inputs are connected to ground and the positive and negative PWM outputs are at 50% duty cycle.

● Play mode: the amplifiers are active.

The protection functions of the TDA7491P are realized by pulling down the voltages of the STBY and MUTE inputs shown in *Figure 50*. The input current of the corresponding pins must be limited to 200 µA.
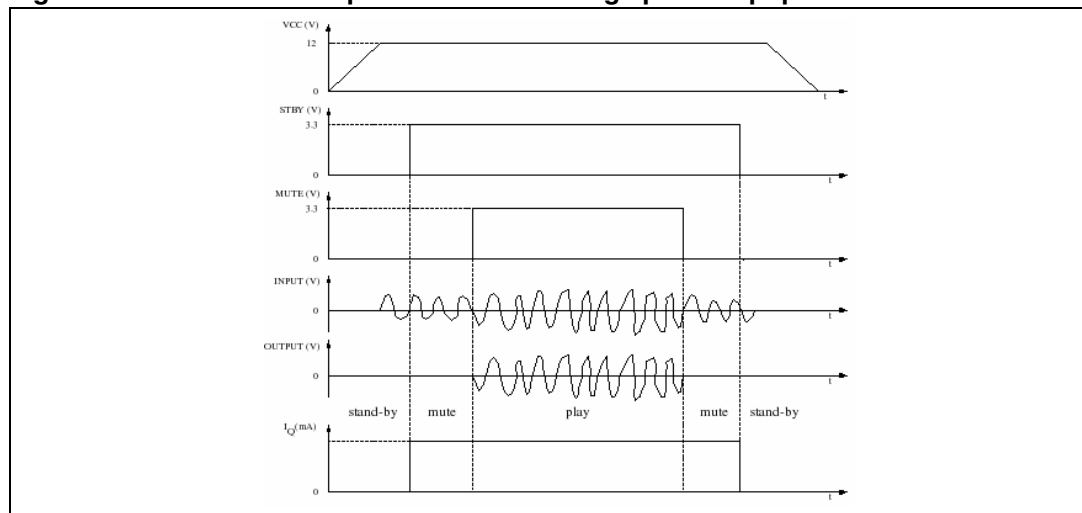

Table 7. **Mode settings**

Mode	STBY	MUTE
Standby	L [1]	X (don't care)
Mute	H [1]	L
Play	H	H

Figure 50. **Standby and mute circuits**
Figure 51. **Turn-on/off sequence for minimizing speaker "pop"**

7.2 Gain setting

The gain of the TDA7491P is set by the two inputs, GAIN0 (pin 30) and GAIN1 (pin 31). Internally, the gain is set by changing the feedback resistors of the amplifier.

Table 8.   Gain settings

| GAIN0	GAIN1	Nominal gain, G_v (dB)
0	0	20
0	1	26
1	0	30
1	1	32

7.3 Input resistance and capacitance

The input impedance is set by an internal resistor Ri = 60 kΩ (typical). An input capacitor (Ci) is required to couple the AC input signal.

The equivalent circuit and frequency response of the input components are shown in *Figure 52*. For Ci = 220 nF the high-pass filter cut-off frequency is below 20 Hz:

$$fc = 1 / (2 * \pi * Ri * Ci)$$

Figure 52.   Device input circuit and frequency response
7.4 Internal and external clocks

The clock of the class-D amplifier can be generated internally or can be driven by an external source.

If two or more class-D amplifiers are used in the same system, it is recommended that all devices operate at the same clock frequency. This can be implemented by using one TDA7491P as master clock, while the other devices are in slave mode (that is, externally clocked. The clock interconnect is via pin SYNCLK of each device. As explained below, SYNCLK is an output in master mode and an input in slave mode.

7.4.1 Master mode (internal clock)

Using the internal oscillator, the output switching frequency, f_{SW}, is controlled by the resistor, R_{OSC}, connected to pin ROSC:

$$f_{SW} = 10^6 / ((16 * R_{OSC} + 182) * 4) \text{ kHz}$$

where R_{OSC} is in kΩ.

In master mode, pin SYNCLK is used as a clock output pin, whose frequency is:

$$f_{SYNCLK} = 2 * f_{SW}$$

For master mode to operate correctly then resistor R_{OSC} must be less than 60 kΩ as given below in *Table 9*.

7.4.2 Slave mode (external clock)

In order to accept an external clock input the pin ROSC must be left open, that is, floating. This forces pin SYNCLK to be internally configured as an input as given in *Table 9*.
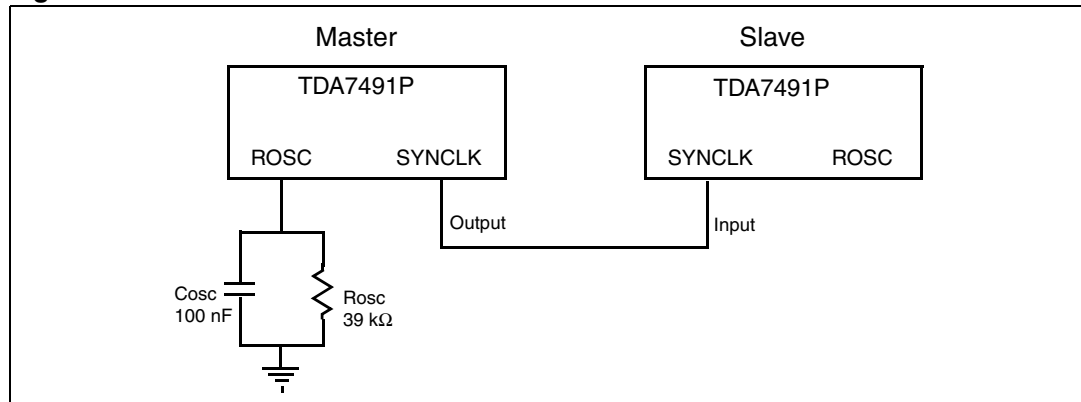

The output switching frequency of the slave devices is:

$$f_{SW} = f_{SYNCLK} / 2$$

Table 9.   How to set up SYNCLK

Mode	ROSC	SYNCLK
Master	R_{OSC} < 60 kΩ	Output
Slave	Floating (not connected)	Input

**Figure 53.   Master and slave connection**

7.5 Filterless modulation

The output modulation scheme of the BTL is called unipolar pulse width modulation (PWM). The differential output voltages change between 0 V and +V_{CC} and between 0 V and -V_{CC}. This is in contrast to the traditional bipolar PWM outputs which change between +V_{CC} and -V_{CC}.

An advantage of this scheme is that it effectively doubles the switching frequency of the differential output waveform. The OUTP and OUTN are in the same phase when the input is zero, then the switching current is low and the loss in the load is small. In practice, a short delay is introduced between these two outputs in order to avoid the BTL output switching at the same time.

TDA7491P can be used without a filter before the speaker, because the frequency of the TDA7491P output is beyond the audio frequency, the audio signal can be recovered by the inherent inductance of the speaker and natural filter of the human ear.

Figure 54. Unipolar PWM output
7.6 Output low-pass filter

To avoid EMI problems, it may be necessary to use a low-pass filter before the speaker. The cutoff frequency should be larger than 22 kHz and much lower than the output switching frequency. It is necessary to choose the L-C component values depending on the loud speaker impedance. Some typical values, which give a cut-off frequency of 27 kHz, are shown in *Figure 55* and *Figure 56* below.

Figure 55.   Typical LC filter for a 8-Ω speaker
Figure 56.   Typical LC filter for a 4-Ω speaker
7.7 Protection function

The TDA7491P is fully protected against overvoltages, undervoltages, overcurrents and thermal overloads as explained here.

Overvoltage protection (OVP)

If the supply voltage exceeds the value for V_{OVP} given in *Table 5: Electrical specifications on page 10* the overvoltage protection is activated which forces the outputs to the high-impedance state. When the supply voltage drops to below the threshold value the device restarts.

Undervoltage protection (UVP)

If the supply voltage drops below the value for V_{UVP} given in *Table 5: Electrical specifications on page 10* the undervoltage protection is activated which forces the outputs to the high-impedance state. When the supply voltage recovers the device restarts.

Overcurrent protection (OCP)

If the output current exceeds the value for I_{OCP} given in *Table 5: Electrical specifications on page 10* the overcurrent protection is activated which forces the outputs to the high-impedance state. Periodically, the device attempts to restart. If the overcurrent condition is still present then the OCP remains active. The restart time, T_{OC}, is determined by the R-C components connected to pin STBY.

Thermal protection (OTP)

If the junction temperature, T_j, reaches 145 °C (nominal), the device goes to mute mode and the positive and negative PWM outputs are forced to 50% duty cycle. If the junction temperature reaches the value for Tj given in *Table 5: Electrical specifications on page 10* the device shuts down and the output is forced to the high impedance state. When the device cools sufficiently the device restarts.

7.8 Diagnostic output

The output pin DIAG is an open drain transistor. When the protection is activated it is in the high-impedance state. The pin can be connected to a power supply (<18 V) by a pull-up resistor whose value is limited by the maximum sinking current (200 μA) of the pin.

Figure 57. Behavior of pin DIAG for various protection conditions
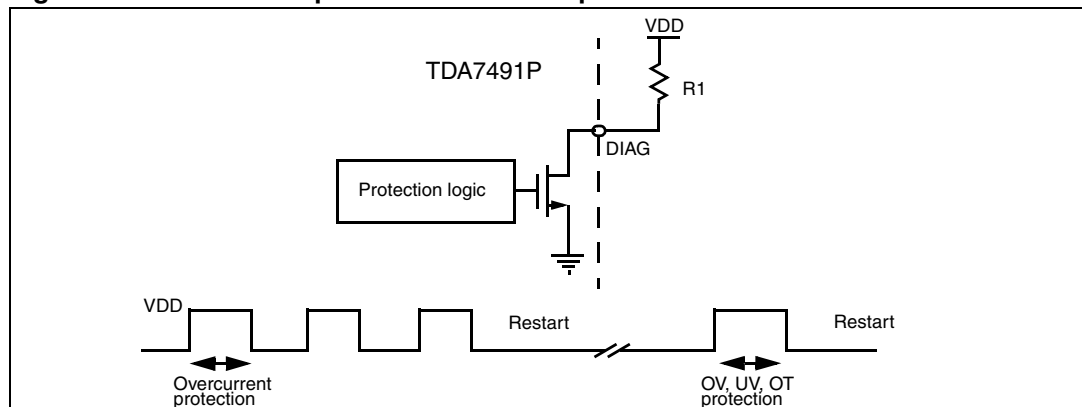

7.9 Heatsink requirements

A thermal resistance of 24 °C/W can be obtained using the PCB copper ground layer with 16 vias connecting it to the contact area for the exposed pad. Ensure that the copper ground area is a nominal 9 cm^2 for 24 °C/W.

Figure 58 shows the derating curves for copper areas of 4 cm^2 and 9 cm^2.

As with most amplifiers, the power dissipated within the device depends primarily on the supply voltage, the load impedance and the output modulation level.

The maximum estimated power dissipation for the TDA7491P is less than 2 W. When properly mounted on the above PCB the junction temperature could increase by 48 °C. However, with a musical program the dissipated power is about 40% less than this, leading to a temperature increase of around only 30 °C. So even at the maximum recommended ambient temperature for consumer applications of 50 °C there is still a clear safety margin before the maximum junction temperature (150 °C) is reached.

Figure 58. Power derating curves for PCB used as heatsink

8   Revision history

Table 10.   Document revision history

Date	Revision	Changes
02-Jul-2007	1	Initial release.
15-Oct-2008	2	Updated characterization curves.
23-Jun-2009	3	Updated text concerning oscillator R and C in *Section 3.3: Electrical specifications on page 10* Updated condition for Iq test, added V_{UVP} maximum value, updated THD maximum value, updated STBY and MUTE voltages in *Table 5: Electrical specifications on page 10* Updated equation for f_{SW} *on page 11* and *on page 34* Updated *Figure 49: Applications circuit for class-D amplifier on page 31* Updated *Section 7.7: Protection function on page 37*.
04-Sep-2009	4	Added text for exposed pad in *Figure 2 on page 8* Added text for exposed pad in *Table 2 on page 9* Updated exposed pad Y (Min) dimension in *Table 6 on page 30* Updated supply voltage for pin DIAG pull-up resistor in *Section 7.8 on page 37*.
