2.7V TO 5.5V LOW-POWER DUAL 10-BIT DIGITAL-TO-ANALOG CONVERTER WITH INTERNAL REFERENCE AND POWER DOWN

FEATURES

- **Dual 10-Bit Voltage Output DAC**
- **Programmable Internal Reference**
- **Programmable Settling Time:**
  - **0.8μs in Fast Mode**
  - **2.8μs in Slow Mode**
- **Compatible With TMS320 and SPI™ Serial Ports**
- **Differential Nonlinearity <0.1LSB Typ**
- **Monotonic Over Temperature**

APPLICATIONS

- **Digital Servo Control Loops**
- **Digital Offset and Gain Adjustment**
- **Industrial Process Control**
- **Machine and Motion Control Devices**
- **Mass Storage Devices**

DESCRIPTION

The TLV5637 is a dual 10-bit voltage output DAC with a flexible 3-wire serial interface. The serial interface allows glueless interface to TMS320 and SPI™, QSPI™, and Microwire™ serial ports. It is programmed with a 16-bit serial string containing 2 control and 10 data bits.

The resistor string output voltage is buffered by a x2 gain rail-to-rail output buffer. The buffer features a Class AB output stage to improve stability and reduce settling time. The programmable settling time of the DAC allows the designer to optimize speed versus power dissipation. With its on-chip programmable precision voltage reference, the TLV5637 simplifies overall system design.

Because of its ability to source up to 1mA, the reference can also be used as a system reference. Implemented with a CMOS process, the device is designed for single supply operation from 2.7V to 5.5V. It is available in an 8-pin SOIC package to reduce board space in standard commercial and industrial temperature ranges.

ABSOLUTE MAXIMUM RATINGS[1]

Over operating free-air temperature range (unless otherwise noted).

		UNIT
Supply voltage (V_{DD} to AGND)		7V
Reference input voltage range		−0.3 V to V_{DD} + 0.3V
Digital input voltage range		−0.3 V to V_{DD} + 0.3V
Operating free-air temperature range, T_A	TLV5637C	0°C to +70°C
	TLV5637I	−40°C to +85°C
Storage temperature range, T_{stg}		−65°C to +150°C
Lead temperature 1,6mm (1/16 inch) from case for 10 seconds		+260°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

PACKAGE/ORDERING INFORMATION

For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.

RECOMMENDED OPERATING CONDITIONS

		MIN	NOM	MAX	UNIT
Supply voltage, V_{DD}	V_{DD} = 5 V	4.5	5	5.5	V
	V_{DD} = 3 V	2.7	3	3.3	V
Power on threshold voltage, POR		0.55		2	V
High-level digital input voltage, V_{IH}	DV_{DD} = 2.7 V	2			V
	DV_{DD} = 5.5 V	2.4			
Low-level digital input voltage, V_{IL}	DV_{DD} = 2.7 V			0.6	V
	DV_{DD} = 5.5 V			1	
Reference voltage, V_{ref} to REF terminal	V_{DD} = 5 V (see [1])	AGND	2.048	V_{DD}−1.5	V
Reference voltage, V_{ref} to REF terminal	V_{DD} = 3 V (see [1])	AGND	1.024	V_{DD}−1.5	V
Load resistance, R_L		2			kΩ
Load capacitance, C_L				100	pF
Clock frequency, f_{CLK}				20	MHz
Operating free-air temperature, T_A	TLV5637C	0		+70	°C
	TLV5637I	−40		+85	

(1) Due to the x2 output buffer, a reference input voltage ≥ (V_{DD} - 0.4V)/2 causes clipping of the transfer function. The output buffer of the internal reference must be disabled, if an external reference is used.

ELECTRICAL CHARACTERISTICS

Over recommended operating conditions (unless otherwise noted).

POWER SUPPLY								
PARAMETER	**TEST CONDITIONS**			**MIN**	**TYP**	**MAX**	**UNIT**
I_{DD} Power supply current	No load, All inputs = AGND or V_{DD}, DAC latch = 0x800	V_{DD} = 5V, Int. ref.	Fast		4.2	7	mA
			Slow		2	3.6	mA
		V_{DD} = 3V, Int. ref.	Fast		3.7	6.3	mA
			Slow		1.7	3.0	mA
		V_{DD} = 5V, Ext. ref.	Fast		3.8	6.3	mA
			Slow		1.7	3.0	mA
		V_{DD} = 3V, Ext. ref.	Fast		3.4	5.7	mA
			Slow		1.4	2.6	mA
Power-down supply current					0.01	10	µA
PSRR Power supply rejection ratio	Zero scale, See [1]				65		dB
	Full scale, See [2]				65		

(1) Power supply rejection ratio at zero scale is measured by varying V_{DD} and is given by: PSRR = 20 log [($E_{ZS}(V_{DD}$max) − $E_{ZS}(V_{DD}$min))/V_{DD}max]
(2) Power supply rejection ratio at full scale is measured by varying V_{DD} and is given by: PSRR = 20 log [($E_G(V_{DD}$max) − $E_G(V_{DD}$min))/V_{DD}max]

STATIC DAC SPECIFICATIONS						
PARAMETER	**TEST CONDITIONS**	**MIN**	**TYP**	**MAX**	**UNIT**
Resolution		10			bits
INL Integral nonlinearity, end point adjusted	See [1]		±0.4	±1	LSB
DNL Differential nonlinearity	See [2]		±0.1	±0.5	LSB
E_{ZS} Zero-scale error (offset error at zero scale)	See [3]			±24	mV
E_{ZS}TC Zero-scale-error temperature coefficient	See [4]		10		ppm/°C
E_G Gain error	See [5]			±0.6	% full scale V
$E_G T_C$ Gain error temperature coefficient	See [6]		10		ppm/°C
OUTPUT SPECIFICATIONS					
V_O Output voltage	R_L = 10kΩ	0		V_{DD}–0.4	V
Output load regulation accuracy	V_O= 4.096V, 2.048V, R_L= 2 kΩ			±0.25	% full scale V

(1) The relative accuracy or integral nonlinearity (INL) sometimes referred to as linearity error, is the maximum deviation of the output from the line between zero and full scale excluding the effects of zero code and full-scale errors. Tested from code 32 to 4095.
(2) The differential nonlinearity (DNL) sometimes referred to as differential error, is the difference between the measured and ideal 1 LSB amplitude change of any two adjacent codes. Monotonic means the output voltage changes in the same direction (or remains constant) as a change in the digital input code.
(3) Zero-scale error is the deviation from zero voltage output when the digital input code is zero.
(4) Zero-scale-error temperature coefficient is given by: E_{ZS} TC = [E_{ZS} (T_{max}) − E_{ZS} (T_{min})]/V_{ref}× 10^6/(T_{max}− T_{min}).
(5) Gain error is the deviation from the ideal output ($2V_{ref}$− 1LSB) with an output load of 10 k excluding the effects of the zero-error.
(6) Gain temperature coefficient is given by: E_G TC = [$E_G(T_{max})$ − E_G (T_{min})]/V_{ref}× 10^6/(T_{max}− T_{min}).

APPLICATION INFORMATION

GENERAL FUNCTION

The TLV5637 is a dual 10-bit, single supply DAC, based on a resistor string architecture. It consists of a serial interface, a speed and power-down control logic, a programmable internal reference, a resistor string, and a rail-to-rail output buffer.

The output voltage (full scale determined by reference) is given by:

$$2\,\text{REF}\,\frac{\text{CODE}}{\text{0x1000}}\,[\text{V}]$$

Where REF is the reference voltage and CODE is the digital input value in the range 0x000 to 0xFFF. Because it is a 10-bit DAC, only D11 to D2 are used. D0 and D1 are ignored. A power-on reset initially puts the internal latches to a defined state (all bits zero).
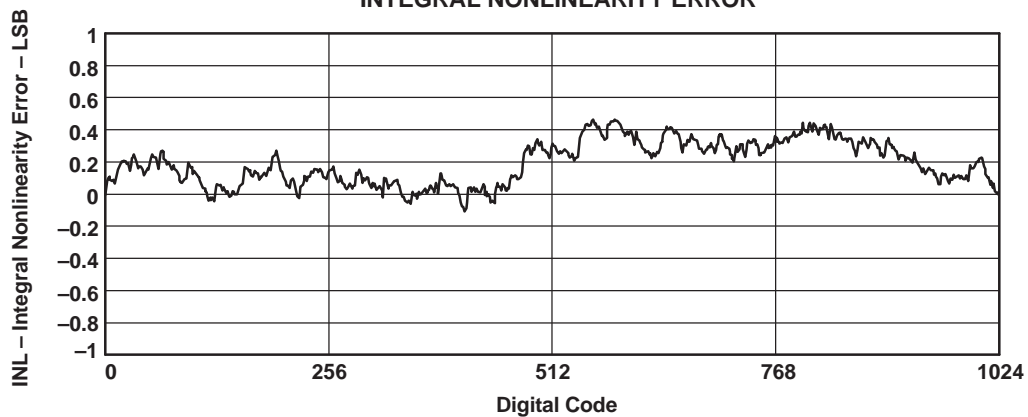

SERIAL INTERFACE

A falling edge of $\overline{\text{CS}}$ starts shifting the data bit-per-bit (starting with the MSB) to the internal register on the falling edges of SCLK. After 16 bits have been transferred or $\overline{\text{CS}}$ rises, the content of the shift register is moved to the target latches (DAC A, DAC B, BUFFER, CONTROL), depending on the control bits within the data word.

Figure 13 shows examples of how to connect the TLV5637 to TMS320, SPI, and Microwire.

TMS320		TLV5637		SPI		TLV5637		Microwire		TLV5637
DSP FSX		$\overline{\text{CS}}$		I/O		$\overline{\text{CS}}$		I/O		$\overline{\text{CS}}$
DX		DIN		MOSI		DIN		SO		DIN
CLKX		SCLK		SCK		SCLK		SK		SCLK
Figure 13. Three-Wire Interface

Notes on SPI and Microwire: Before the controller starts the data transfer, the software has to generate a falling edge on the I/O pin connected to $\overline{\text{CS}}$. If the word width is 8 bits (SPI and Microwire), two write operations must be performed to program the TLV5637. After the write operation(s), the holding registers or the control register are updated automatically on the 16th positive clock edge.

SERIAL CLOCK FREQUENCY AND UPDATE RATE

The maximum serial clock frequency is given by:

$$f_{\text{sclkmax}} = \frac{1}{(t_{\text{whmin}} + t_{\text{wlmin}})} = 20\text{MHz}$$

The maximum update rate is:

$$f_{\text{updatemax}} = \frac{1}{16\,(t_{\text{whmin}} + t_{\text{wlmin}})} = 1.25\text{MHz}$$

Note that the maximum update rate is just a theoretical value for the serial interface, as the settling time of the TLV5637 has to be considered as well.

APPLICATION INFORMATION (continued)

DATA FORMAT

The 16-bit data word for the TLV5637 consists of two parts:

- Program bits (D15..D12)
- New data (D11..D0)

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
R1	SPD	PWR	R0	12 Data bits											

SPD: Speed control bit 1→ fast mode 0 → slow mode

PWR: Power control bit 1 → power down 0 → normal operation

The following table lists the possible combination of the register select bits:

Register Select Bits

R1	R0	REGISTER
0	0	Write data to DAC B and BUFFER
0	1	Write data to BUFFER
1	0	Write data to DAC A and update DAC B with BUFFER content
1	1	Write data to control register

The meaning of the 12 data bits depends on the register. If one of the DAC registers or the BUFFER is selected, then the 12 data bits determine the new DAC value:

Data Bits: DAC A, DAC B and BUFFER

D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
New DAC Value										0	0

If control is selected, then D1, D0 of the 12 data bits are used to program the reference voltage:

Data Bits: CONTROL

D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
X	X	X	X	X	X	X	X	X	X	REF1	REF0
X: don't care											

REF1 and REF0 determine the reference source and, if internal reference is selected, the reference voltage.

TEXAS INSTRUMENTS
www.ti.com

APPLICATION INFORMATION

REFERENCE BITS

REF1	REF0	REFERENCE
0	0	External
0	1	1.024V
1	0	2.048V
1	1	External

CAUTION:

If external refeence voltage is applied to the REF pin, external reference MUST be selected.

EXAMPLES OF OPERATION:

1. Set DAC A output, select fast mode, select internal reference at 2.048V:

   a. Set reference voltage to 2.048V (CONTROL register)

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
1	1	0	1	0	0	0	0	0	0	0	0	0	0	1	0

   b. Write new DAC A value and update DAC A output:

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
1	1	0	0	New DAC A output value										0	0

   The DAC A output is updated on the rising clock edge after D0 is sampled.

   To output data consecutively using the same DAC configuration, it is not necessary to program the CONTROL register again.

2. Set DAC B output, select fast mode, select external reference:

   a. Select external reference (CONTROL register):

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
1	1	0	1	0	0	0	0	0	0	0	0	0	0	0	0

   b. Write new DAC B value to BUFFER and update DAC B output:

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	0	New BUFFER content and DAC B output value										0	0

   The DAC A output is updated on the rising clock edge after D0 is sampled.

   To output data consecutively using the same DAC configuration, it is not necessary to program the CONTROL register again.

1. Set DAC A value, set DAC B value, update both simultaneously, select slow mode, select internal reference at 1.024V:

   a. Set reference voltage to 1.024V (CONTROL register):

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
1	0	0	1	0	0	0	0	0	0	0	0	0	0	0	1

   b. Write data for DAC B to BUFFER:

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	1	New DAC B value										0	0

   c. Write new DAC A value and update DAC A and B simultaneously:

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
1	0	0	0	New DAC A value										0	0

   Both outputs are updated on the rising clock edge after D0 from the DAC A data word is sampled.

2. Set power down mode:

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
X	X	1	X	X	X	X	X	X	X	X	X	X	X	X	X

X = Don't care

Submit Documentation Feedback

LINEARITY, OFFSET, AND GAIN ERROR USING SINGLE ENDED SUPPLIES

When an amplifier is operated from a single supply, the voltage offset can still be either positive or negative. With a positive offset, the output voltage changes on the first code change. With a negative offset, the output voltage may not change with the first code, depending on the magnitude of the offset voltage.

The output amplifier attempts to drive the output to a negative voltage. However, because the most negative supply rail is ground, the output cannot drive below ground and clamps the output at 0V.

The output voltage then remains at zero until the input code value produces a sufficiently positive output voltage to overcome the negative offset voltage, resulting in the transfer function shown in Figure 14.

Figure 14. Effect of Negative Offset (Single Supply)

This offset error, not the linearity error, produces this breakpoint. The transfer function would have followed the dotted line if the output buffer could drive below the ground rail.

For a DAC, linearity is measured between zero-input code (all inputs 0) and full-scale code (all inputs 1) after offset and full scale are adjusted out or accounted for in some way. However, single supply operation does not allow for adjustment when the offset is negative due to the breakpoint in the transfer function. So the linearity is measured between full-scale code and the lowest code that produces a positive output voltage.

DEFINITIONS OF SPECIFICATIONS AND TERMINOLOGY

Integral Nonlinearity (INL)

The relative accuracy or integral nonlinearity (INL), sometimes referred to as linearity error, is the maximum deviation of the output from the line between zero and full scale excluding the effects of zero code and full-scale errors.

Differential Nonlinearity (DNL)

The differential nonlinearity (DNL), sometimes referred to as differential error, is the difference between the measured and ideal 1LSB amplitude change of any two adjacent codes. Monotonic means the output voltage changes in the same direction (or remains constant) as a change in the digital input code.

Zero-Scale Error (E_{ZS})

Zero-scale error is defined as the deviation of the output from 0V at a digital input value of 0.

GAIN ERROR (E_G)

Gain error is the error in slope of the DAC transfer function.

SIGNAL-TO-NOISE RATIO + DISTORTION (S/N+D)

S/N+D is the ratio of the rms value of the measured input signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding dc. The value for S/N+D is expressed in decibels.

SPURIOUS FREE DYNAMIC RANGE (SFDR)

Spurious free dynamic range is the difference between the rms value of the output signal and the rms value of the spurious signal within a specified bandwidth. The value for SFDR is expressed in decibels.

[1] The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

[2] Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

[3] MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
