

# LM6152/LM6154 Dual and Quad High Speed/Low Power 75 MHz GBW Rail-to-Rail I/O Operational Amplifiers

National Semiconductor

May 1999

## LM6152/LM6154

### Dual and Quad High Speed/Low Power 75 MHz GBW Rail-to-Rail I/O Operational Amplifiers

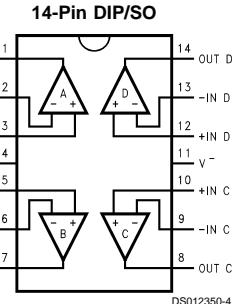

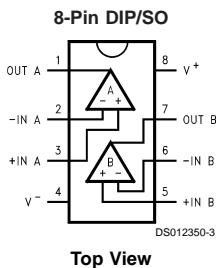

#### General Description

Using patented circuit topologies, the LM6152/54 provides new levels of speed vs. power performance in applications where low voltage supplies or power limitations previously made compromise necessary. With only 1.4 mA/amplifier supply current, the 75 MHz gain bandwidth of this device supports new portable applications where higher power devices unacceptably drain battery life. The slew rate of the devices increases with increasing input differential voltage, thus allowing the device to handle capacitive loads while maintaining large signal amplitude.

The LM6152/54 can be driven by voltages that exceed both power supply rails, thus eliminating concerns about exceeding the common-mode voltage range. The rail-to-rail output swing capability provides the maximum possible dynamic range at the output. This is particularly important when operating on low supply voltages.

Operating on supplies from 2.7V to over 24V, the LM6152/54 is excellent for a very wide range of applications, from battery operated systems with large bandwidth requirements to high speed instrumentation.

#### Connection Diagrams

#### Features

At  $V_S = 5V$ , Typ unless noted

- Greater than Rail-to-Rail Input CMVR  $-0.25V$  to  $5.25V$
- Rail-to-Rail Output Swing  $0.01V$  to  $4.99V$
- Wide Gain-Bandwidth:  $75\text{ MHz}$  @  $100\text{ kHz}$
- Slew Rate:
  - Small signal  $5V/\mu s$
  - Large signal  $45V/\mu s$
- Low supply current  $1.4\text{mA}/\text{amplifier}$
- Wide supply range  $2.7V$  to  $24V$
- Fast settling time of  $1.1\mu s$  for  $2V$  step (to 0.01%)
- PSRR  $91\text{ dB}$
- CMRR  $84\text{ dB}$

#### Applications

- Portable high speed instrumentation
- Signal conditioning amplifier/ADC buffers
- Barcode scanners

## Ordering Information

| Packaged    | Ordering Infomation    | NSC Drawing Number | Supplied As        |
|-------------|------------------------|--------------------|--------------------|
| 8-Pin Dip   | LM6152ACN, LM5152BCN   | N08E               | Rails              |
| 8-Pin SOIC  | LM6152ACM, LM6152BCM   | M08A               | Rails              |
|             | LM6152ACMX, LM6152BCMX | M08A               | 2.5k Tape and Reel |
| 14-Pin DIP  | LM6154ACN, LM6154BCN   | N14A               | Rails              |
| 14-Pin SOIC | LM6154ACM, LM6154BCM   | M14A               | Rails              |
|             | LM6154ACMX, LM6154BCMX | M14A               | 2.5k Tape and Reel |

### Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

## 24V AC Electrical Characteristics

Unless otherwise specified, all limits guaranteed for  $T_J = 25^\circ\text{C}$ ,  $V^+ = 24\text{V}$ ,  $V^- = 0\text{V}$ ,  $V_{CM} = V_O = V^+/2$  and  $R_L > 1 \text{ M}\Omega$  to  $V^+/2$ . **Boldface** limits apply at the temperature extremes.

| Symbol | Parameter              | Conditions          | Typ<br>(Note 5) | LM6154AC<br>LM6152AC<br>Limit<br>(Note 6) | LM6154BC<br>LM6152BC<br>Limit<br>(Note 6) | Units |
|--------|------------------------|---------------------|-----------------|---|---|-------|
| GBW    | Gain-Bandwidth Product | $f = 100\text{kHz}$ | 80              |   |   | MHz   |

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not guaranteed. For guaranteed specifications and the test conditions, see the Electrical Characteristics.

**Note 2:** Human body model,  $1.5\text{k}\Omega$  in series with  $100\text{pF}$ .

**Note 3:** Applies to both single-supply and split-supply operation. Continuous short circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of  $150^\circ\text{C}$ .

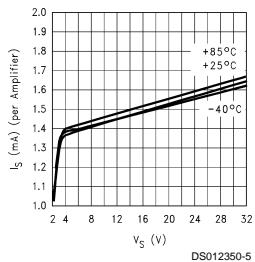

**Note 4:** The maximum power dissipation is a function of  $T_{J(max)}$ ,  $\theta_{JA}$ , and  $T_A$ . The maximum allowable power dissipation at any ambient temperature is  $P_D = (T_{J(max)} - T_A)/\theta_{JA}$ . All numbers apply for packages soldered directly into a PC board.

**Note 5:** Typical Values represent the most likely parametric norm.

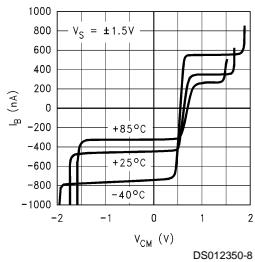

**Note 6:** All limits are guaranteed by testing or statistical analysis.

## Application Information

The LM6152/6154 is ideally suited for operation with about  $10\text{k}\Omega$  (Feedback Resistor,  $R_F$ ) between the output and the negative input terminal.

With  $R_F$  set to this value, for most applications requiring a close loop gain of 10 or less, an additional small compensation capacitor ( $C_F$ ) (see Figure 1) is recommended across  $R_F$  in order to achieve a reasonable overshoot (10%) at the output by compensating for stray capacitance across the inputs.

The optimum value for  $C_F$  can best be established experimentally with a trimmer cap in place since its value is dependent on the supply voltage, output driving load, and the operating gain. Below, some typical values used in an inverting configuration and driving a  $10\text{k}\Omega$  load have been tabulated for reference:

TABLE 1. Typical BW (-3 dB) at Various Supply Voltage and Gains

| $V_S$<br>Volts | Gain | $C_F$<br>pF | BW (-3 dB)<br>MHz |
|----------------|------|-------------|-------------------|
| 3              | -1   | 5.6         | 4                 |
|                | -10  | 6.8         | 1.97              |
|                | -100 | None        | 0.797             |
| 24             | -1   | 2.2         | 6.6               |
|                | -10  | 4.7         | 2.2               |
|                | -100 | None        | 0.962             |

In the non-inverting configuration, the LM6152/6154 can be used for closed loop gains of +2 and above. In this case, also, the compensation capacitor ( $C_F$ ) is recommended across  $R_F$  ( $= 10\text{k}\Omega$ ) for gains of 10 or less.

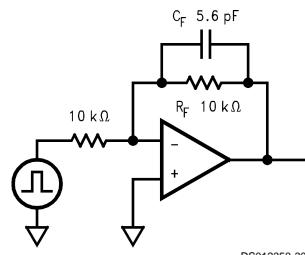

FIGURE 1. Typical Inverting Gain Circuit  $A_V = -1$

Because of the unique structure of this amplifier, when used at low closed loop gains, the realizable BW will be much less than the GBW product would suggest.

The LM6152/6154 brings a new level of ease of use to op amp system design.

The greater than rail-to-rail input voltage range eliminates concern over exceeding the common-mode voltage range. The rail-to-rail output swing provides the maximum possible dynamic range at the output. This is particularly important when operating on low supply voltages.

The high gain-bandwidth with low supply current opens new battery powered applications where higher power consumption previously reduced battery life to unacceptable levels.

The ability to drive large capacitive loads without oscillating functional removes this common problem.

To take advantage of these features, some ideas should be kept in mind.

The LM6152/6154, capacitive loads do not lead to oscillations, in all but the most extreme conditions, but they will result in reduced bandwidth. They also cause increased settling time.

Unlike most bipolar op amps, the unique phase reversal prevention/speed-up circuit in the input stage, caused the slew rate to be very much a function of the input pulse amplitude. This results in a 10 to 1 increase in slew rate when the differential input signal increases. Large fast pulses will raise the slew-rate to more than  $30\text{V}/\mu\text{s}$ .

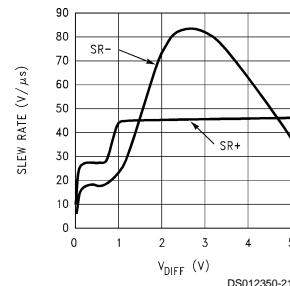

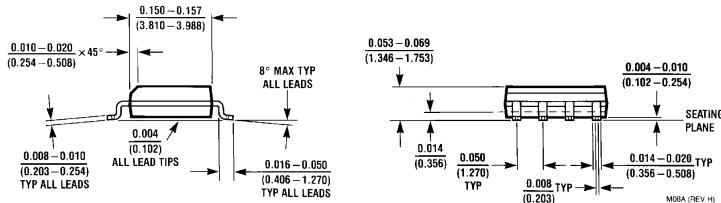

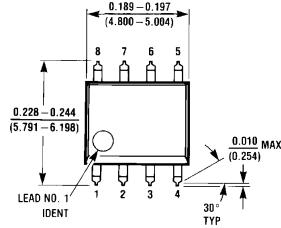

FIGURE 2. Slew Rate vs.  $V_{diff}$

The speed-up action adds stability to the system when driving large capacitive loads.

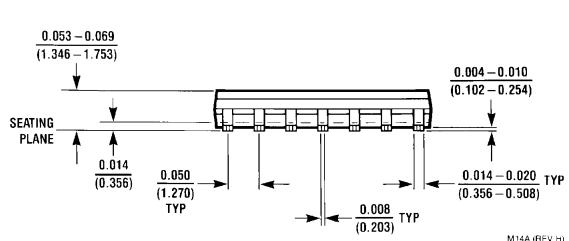

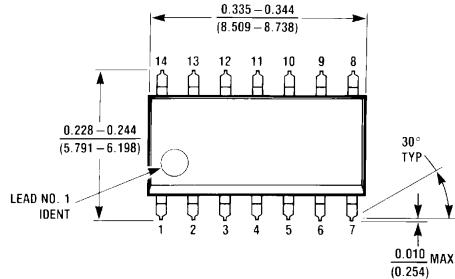

A conventional op amp exhibits a fixed maximum slew-rate even though the differential input voltage rises due to the lagging output voltage. In the LM6152/6154, increasing lag causes the differential input voltage to increase but as it does, the increased slew-rate keeps the output following the input much better. This effectively reduces phase lag. As a result, the LM6152/6154 can drive capacitive loads as large as  $470\text{ pF}$  at gain of 2 and above, and not oscillate.

Capacitive loads decrease the phase margin of all op amps. This can lead to overshoot, ringing and oscillation. This is caused by the output resistance of the amplifier and the load capacitance forming an R-C phase shift network. The LM6152/6154 senses this phase shift and partly compensates for this effect.

### LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
