VIDEO, CHROMA AND SYNCHRONIZING SIGNALS PROCESSING IC FOR PAL / NTSC / SECAM SYSTEM COLOR TV

TB1227BN that is a signal processing IC for the PAL/NTSC/SECAM color TV system integrates video, chroma and synchronizing signal processing circuits together in a 56-pin shrink DIP plastic package.

TB1227BN incorporates a high performance picture quality compensation circuit in the video section, an automatic PAL/NTSC/SECAM discrimination circuit in the chroma section, and an automatic 50/60Hz discrimination circuit in the synchronizing section. Besides a crystal oscillator that internally generates 4.43MHz, 3.58MHz and M/N-PAL clock signals for color demodulation, there is a horizontal PLL circuit built in the IC.

The PAL/SECAM demodulation circuit which is an adjustment-free circuit incorporates a 1H DL circuit inside for operating the base band signal processing system.

Also, TB1227BN makes it possible to set or control various functions through the built-in I²C bus line.

Data receive format

At the moment of the first acknowledge, the master transmitter becomes a master receiver and the slave receiver becomes a slave transmitter. This acknowledge is still generated by the slave.

The STOP condition is generated by the master.

Optional data transmit format : Automatic increment mode

In this transmission method, data is set on automatically incremented sub-address from the specified sub-address.

(5) While shifting color phase (tint) from minimum to maximum by the bus control, measure phase change of B-Y color difference output of pin 36. Detailed description: This is a graph titled 'RGB output' versus 'BUS'. It shows a linear relationship where the RGB output increases proportionally with the bus value. The minimum output level is denoted as V_{cmin} and the maximum as V_{cmh}. A specific point on the line is identified as the average of these two values, (V_{cmh} + V_{cmin}) / 2.
