

## FEATURES

- 0.4V Dropout Voltage
- 700mA Output Current
- 50 $\mu$ A Quiescent Current
- No Protection Diodes Needed
- Adjustable Output from 3.8V to 30V
- 3.3V and 5V Fixed Output Voltages
- Controlled Quiescent Current in Dropout
- Shutdown
- 16 $\mu$ A Quiescent Current in Shutdown
- Stable with 3.3 $\mu$ F Output Capacitor
- Reverse Battery Protection
- No Reverse Output Current
- Thermal Limiting
- Surface Mount SOT-223 and DD Packages
- 1.1mm Thick Surface Mount TSSOP Package

## APPLICATIONS

- Low Current Regulator
- Regulator for Battery-Powered Systems
- Post Regulator for Switching Supplies
- 5V to 3.3V Logic Regulator

## DESCRIPTION

The LT<sup>®</sup>1129/LT1129-3.3/LT1129-5 are micropower low dropout regulators with shutdown. The devices are capable of supplying 700mA of output current with a dropout voltage of 0.4V at maximum output. Designed for use in battery-powered systems the low quiescent current, 50 $\mu$ A operating and 16 $\mu$ A in shutdown, make them an ideal choice. The quiescent current does not rise in dropout as it does with many other low dropout PNP regulators.

Other features of the LT1129 /LT1129-3.3/LT1129-5 include the ability to operate with small output capacitors. They are stable with only 3.3 $\mu$ F on the output while most older devices require between 10 $\mu$ F and 100 $\mu$ F for stability. Also the input may be connected to ground or a reverse voltage without reverse current flow from output to input. This makes the LT1129/LT1129-3.3/LT1129-5 ideal for backup power situations where the output is held high and the input is at ground or reversed. Under these conditions, only 16 $\mu$ A will flow from the output pin to ground. The devices are available in 5-lead TO-220, 5-lead DD, 3-lead SOT-223 and 20-lead TSSOP packages.

 LTC and LT are registered trademarks of Linear Technology Corporation.

## ELECTRICAL CHARACTERISTICS

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

**Note 2:** The shutdown pin input voltage rating is required for a low impedance source. Internal protection devices connected to the shutdown pin will turn on and clamp the pin to approximately 7V or  $-0.6V$ . This range allows the use of 5V logic devices to drive the pin directly. For high impedance sources or logic running on supply voltages greater than 5.5V, the maximum current driven into the shutdown pin must be limited to less than 20mA.

**Note 3:** For junction temperatures greater than  $110^{\circ}C$ , a minimum load of 1mA is recommended. For  $T_J > 110^{\circ}C$  and  $I_{OUT} < 1mA$ , output voltage may increase by 1%.

**Note 4:** Operating conditions are limited by maximum junction temperature. The regulated output voltage specification will not apply for all possible combinations of input voltage and output current. When operating at maximum input voltage, the output current range must be limited. When operating at maximum output current the input voltage range must be limited.

**Note 5:** The LT1129 is tested and specified with the adjust pin connected to the output pin.

**Note 6:** Dropout voltage is the minimum input/output voltage required to maintain regulation at the specified output current. In dropout the output voltage will be equal to  $(V_{IN} - V_{DROPOUT})$ . Dropout voltage is measured between the input pin and the output pin. External voltage drops between the output pin and the sense pin will add to the dropout voltage.

**Note 7:** Ground pin current is tested with  $V_{IN} = V_{OUT}$  (nominal) and a current source load. This means that the device is tested while operating in its dropout region. This is the worst case ground pin current. The ground pin current will decrease slightly at higher input voltages.

**Note 8:** Adjust pin bias current flows into the adjust pin.

**Note 9:** Shutdown pin current at  $V_{SHDN} = 0V$  flows out of the shutdown pin.

**Note 10:** Quiescent current in shutdown is equal to the sum total of the shutdown pin current (6 $\mu A$ ) and the ground pin current (9 $\mu A$ ).

**Note 11:** Reverse output current is tested with the input pin grounded. The output pin and the sense pin are forced to the rated output voltage. This current flows into the sense pin and out of the ground pin. For the LT1129 (adjustable version) the sense pin is internally tied to the output pin.

**Note 12:** For C-grade devices Regulated Output Voltage, Line Regulation, and Load Regulation are guaranteed over the extended temperature range of  $-40^{\circ}C$  to  $125^{\circ}C$ . These parameters are not tested or quality assurance sampled at  $-40^{\circ}C$ . They are guaranteed by design, correlation and/or inference from  $25^{\circ}C$  and/or  $0^{\circ}C$  tests.

## TYPICAL PERFORMANCE CHARACTERISTICS

## PIN FUNCTIONS

**Input Pin:** Power is supplied to the device through the input pin. The input pin should be bypassed to ground if the device is more than 6 inches away from the main input filter capacitor. In general, the output impedance of a battery rises with frequency so it is advisable to include a bypass capacitor in battery-powered circuits. A bypass capacitor in the range of  $1\mu\text{F}$  to  $10\mu\text{F}$  is sufficient. The LT1129 is designed to withstand reverse voltages on the input pin with respect to both ground and the output pin. In the case of a reversed input, which can happen if a battery is plugged in backwards, the LT1129 will act as if there is a diode in series with its input. There will be no reverse current flow into the LT1129 and no reverse voltage will appear at the load. The device will protect both itself and the load.

**Output Pin:** The output pin supplies power to the load. An output capacitor is required to prevent oscillations. See the Applications Information section for recommended value of output capacitance and information on reverse output characteristics.

**Shutdown Pin (SHDN):** This pin is used to put the device into shutdown. In shutdown the output of the device is turned off. This pin is active low. The device will be shut down if the shutdown pin is actively pulled low. The shutdown pin current with the pin pulled to ground will be

$6\mu\text{A}$ . The shutdown pin is internally clamped to  $7V$  and  $-0.6V$  (one  $V_{BE}$ ). This allows the shutdown pin to be driven directly by  $5V$  logic or by open collector logic with a pull-up resistor. The pull-up resistor is only required to supply the leakage current of the open collector gate, normally several microamperes. Pull-up current must be limited to a maximum of  $20\text{mA}$ . A curve of shutdown pin input current as a function of voltage appears in the Typical Performance Characteristics. If the shutdown pin is not used it can be left open circuit. The device will be active, output on, if the shutdown pin is not connected.

**Sense Pin:** For fixed voltage versions of the LT1129 (LT1129-3.3, LT1129-5) the sense pin is the input to the error amplifier. Optimum regulation will be obtained at the point where the sense pin is connected to the output pin. For most applications the sense pin is connected directly to the output pin at the regulator. In critical applications small voltage drops caused by the resistance ( $R_P$ ) of PC traces between the regulator and the load, which would normally degrade regulation, may be eliminated by connecting the sense pin to the output pin at the load as shown in Figure 1 (Kelvin Sense Connection). Note that the voltage drop across the external PC traces will add to the dropout voltage of the regulator. The sense pin bias current is  $15\mu\text{A}$  at the nominal regulated output voltage. This pin is internally clamped to  $-0.6V$  (one  $V_{BE}$ ).

## PIN FUNCTIONS

**Adjust Pin:** For the LT1129 (adjustable version) the adjust pin is the input to the error amplifier. This pin is internally clamped to 6V and  $-0.6V$  (one  $V_{BE}$ ). This pin has a bias current of 150nA which flows into the pin. See Bias Current curve in the Typical Performance Characteristics. The adjust pin reference voltage is equal to 3.75V referenced to ground.

Figure 1. Kelvin Sense Connection

## APPLICATIONS INFORMATION

The LT1129 is a micropower low dropout regulator with shutdown, capable of supplying 700mA of output current at a dropout voltage of 0.4V. The device operates with very low quiescent current (50µA). In shutdown the quiescent current drops to only 16µA. In addition to the low quiescent current the LT1129 incorporates several protection features which make it ideal for use in battery-powered systems. The device is protected against reverse input voltages. In battery backup applications where the output can be held up by a backup battery when the input is pulled to ground, the LT1129 acts like it has a diode in series with its output and prevents reverse current flow.

### Adjustable Operation

The adjustable version of the LT1129 has an output voltage range of 3.75V to 30V. The output voltage is set by the ratio of two external resistors as shown in Figure 2. The device servos the output voltage to maintain the voltage at the adjust pin at 3.75V. The current in R1 is then equal to  $3.75V/R1$ . The current in R2 is equal to the sum of the current in R1 and the adjust pin bias current. The adjust pin bias current, 150nA at 25°C, flows through R2 into the adjust pin. The output voltage can be calculated according to the formula in Figure 2. The value of R1 should be less than 400k to minimize errors in the output voltage caused by the adjust pin bias current. Note that in shutdown the output is turned off and the divider current will be zero. Curves of Adjust Pin Voltage vs Temperature and Adjust Pin Bias Current vs Temperature appear in the Typical

Performance Characteristics. The reference voltage at the adjust pin has a positive temperature coefficient of approximately 15ppm/°C. The adjust pin bias current has a negative temperature coefficient. These effects are small and will tend to cancel each other.

The adjustable device is specified with the adjust pin tied to the output pin. This sets the output voltage to 3.75V. Specifications for output voltages greater than 3.75V will be proportional to the ratio of the desired output voltage to 3.75V ( $V_{OUT}/3.75V$ ). For example: load regulation for an output current change of 1mA to 700mA is  $-6mV$  typical at  $V_{OUT} = 3.75V$ . At  $V_{OUT} = 12V$ , load regulation would be:

$$\left(\frac{12V}{3.75V}\right) \cdot (-6mV) = (-19mV)$$

$$V_{OUT} = 3.75V \left(1 + \frac{R2}{R1}\right) + (I_{ADJ} \cdot R2)$$

$$V_{ADJ} = 3.75V$$

$$I_{ADJ} = 150nA \text{ at } 25^\circ C$$

$$OUTPUT \text{ RANGE} = 3.75V \text{ to } 30V$$

Figure 2. Adjustable Operation

## APPLICATIONS INFORMATION

### Thermal Considerations

The power handling capability of the device will be limited by the maximum rated junction temperature (125°C). The power dissipated by the device will be made up of two components:

1. Output current multiplied by the input/output voltage differential:  $I_{OUT} \cdot (V_{IN} - V_{OUT})$ , and
2. Ground pin current multiplied by the input voltage:  $I_{GND} \cdot V_{IN}$ .

The ground pin current can be found by examining the Ground Pin Current curves in the Typical Performance Characteristics. Power dissipation will be equal to the sum of the two components listed above.

The LT1129 series regulators have internal thermal limiting designed to protect the device during overload conditions. For continuous normal load conditions the maximum junction temperature rating of 125°C must not be exceeded. It is important to give careful consideration to all sources of thermal resistance from junction to ambient. Additional heat sources mounted nearby must also be considered.

For surface mount devices heat sinking is accomplished by using the heat spreading capabilities of the PC board and its copper traces. Experiments have shown that the heat spreading copper layer does not need to be electrically connected to the tab of the device. The PC material can be very effective at transmitting heat between the pad area, attached to the tab of the device, and a ground or power plane layer either inside or on the opposite side of the board. Although the actual thermal resistance of the PC material is high, the length/area ratio of the thermal resistor between layers is small. Copper board stiffeners and plated through holes can also be used to spread the heat generated by power devices.

The following tables list thermal resistances for each package. For the TO-220 package, thermal resistance is given for junction-to-case only since this package is usually mounted to a heat sink. Measured values of thermal resistance for several different board sizes and copper areas are listed for each package. All measurements were taken in still air on 3/32" FR-4 board with 1-oz

copper. This data can be used as a rough guideline in estimating thermal resistance. The thermal resistance for each application will be affected by thermal interactions with other components as well as board size and shape. Some experimentation will be necessary to determine the actual value.

### T Package, 5-Lead TO-220

Thermal Resistance (Junction-to-Case) = 5°C/W

## APPLICATIONS INFORMATION

### Calculating Junction Temperature

Example: Given an output voltage of 3.3V, an input voltage range of 4.5V to 5.5V, an output current range of 0mA to 500mA, and a maximum ambient temperature of 50°C, what will the maximum junction temperature be?

The power dissipated by the device will be equal to:

$$I_{OUT\ MAX} \cdot (V_{IN\ MAX} - V_{OUT}) + (I_{GND} \cdot V_{IN\ MAX})$$

where,  $I_{OUT\ MAX} = 500\text{mA}$

$$V_{IN\ MAX} = 5.5\text{V}$$

$$I_{GND} \text{ at } (I_{OUT} = 500\text{mA}, V_{IN} = 5.5\text{V}) = 25\text{mA}$$

$$\text{so, } P = 500\text{mA} \cdot (5.5\text{V} - 3.3\text{V}) + (25\text{mA} \cdot 5.5\text{V}) \\ = 1.24\text{W}$$

If we use a DD package, then the thermal resistance will be in the range of 25°C/W to 35°C/W depending on copper area. So the junction temperature rise above ambient will be approximately equal to:

$$1.24\text{W} \cdot 30^\circ\text{C/W} = 37.2^\circ\text{C}$$

The maximum junction temperature will then be equal to the maximum junction temperature rise above ambient plus the maximum ambient temperature or:

$$T_{JMAX} = 50^\circ\text{C} + 37.2^\circ\text{C} = 87.2^\circ\text{C}$$

### Output Capacitance and Transient Performance

The LT1129 is designed to be stable with a wide range of output capacitors. The minimum recommended value is 3.3μF with an ESR of 2Ω or less. The LT1129 is a micropower device and output transient response will be a function of output capacitance. See the Transient Response curves in the Typical Performance Characteristics. Larger values of output capacitance will decrease the peak deviations and provide improved output transient response. Bypass capacitors, used to decouple individual components powered by the LT1129, will increase the effective value of the output capacitor.

### Protection Features

The LT1129 incorporates several protection features which make it ideal for use in battery-powered circuits. In addition to the normal protection features associated with monolithic regulators, such as current limiting and thermal limiting, the device is protected against reverse input voltages, and reverse voltages from output to input. For fixed voltage devices the output and sense pins are tied together at the output.

Current limit protection and thermal overload protection are intended to protect the device against current overload conditions at the output of the device. For normal operation, the junction temperature should not exceed 125°C.

The input of the device will withstand reverse voltages of 30V. Current flow into the device will be limited to less than 1mA (typically less than 100μA) and no negative voltage will appear at the output. The device will protect both itself and the load. This provides protection against batteries that can be plugged in backwards.

For fixed voltage versions of the device, the sense pin is internally clamped to one diode drop below ground. For the adjustable version of the device, the output pin is internally clamped at one diode drop below ground. If the output pin of an adjustable device, or the sense pin of a fixed voltage device, is pulled below ground, with the input open or grounded, current must be limited to less than 5mA.

In circuits where a backup battery is required, several different input/output conditions can occur. The output voltage may be held up while the input is either pulled to ground, pulled to some intermediate voltage, or is left open circuit. Current flow back into the output will vary depending on the conditions. Many battery-powered circuits incorporate some form of power management. The following information will help optimize battery life. Table 3 summarizes the following information.

The reverse output current will follow the curve in Figure 3 when the input pin is pulled to ground. This current flows through the output pin to ground. The state of the shutdown pin will have no effect on output current when the input pin is pulled to ground.

## APPLICATIONS INFORMATION

In some applications it may be necessary to leave the input to the LT1129 unconnected when the output is held high. This can happen when the LT1129 is powered from a rectified AC source. If the AC source is removed, then the input of the LT1129 is effectively left floating. The reverse output current also follows the curve in Figure 3 if the input pin is left open. The state of the shutdown pin will have no effect on the reverse output current when the input pin is floating.

When the input of the LT1129 is forced to a voltage below its nominal output voltage and its output is held high, the reverse output current will still follow the curve shown in Figure 3. This can happen if the input of the LT1129 is connected to a discharged (low voltage) battery and the output is held up by either a backup battery or by a second regulator circuit.

When the input pin is forced below the output pin or the output pin is pulled above the input pin, the input current will typically drop to less than 2µA (see Figure 4). The state of the shutdown pin will have no effect on the reverse output current when the output is pulled above the input.

Figure 3. Reverse Output Current

Figure 4. Input Current

Table 5. Fault Conditions

INPUT PIN	SHDN PIN	OUTPUT PIN	
< V <sub>OUT</sub> (Nominal)	Open (Hi)	Forced to V <sub>OUT</sub> (Nominal)	Reverse Output Current ≈ 15µA (See Figure 3) Input Current ≈ 1µA (See Figure 4)
< V <sub>OUT</sub> (Nominal)	Grounded	Forced to V <sub>OUT</sub> (Nominal)	Reverse Output Current ≈ 15µA (See Figure 3) Input Current ≈ 1µA (See Figure 4)
Open	Open (Hi)	Forced to V <sub>OUT</sub> (Nominal)	Reverse Output Current ≈ 15µA (See Figure 3)
Open	Grounded	Forced to V <sub>OUT</sub> (Nominal)	Reverse Output Current ≈ 15µA (See Figure 3)

**PACKAGE DESCRIPTION**

Dimensions in inches (millimeters) unless otherwise noted.

**F Package**  
**20-Lead Plastic TSSOP (4.4mm)**  
 (LTC DWG # 05-08-1650)

NOTE: DIMENSIONS ARE IN MILLIMETERS  
 \*DIMENSIONS DO NOT INCLUDE MOLD FLASH. MOLD FLASH SHALL NOT EXCEED 0.152mm (0.006") PER SIDE  
 \*\*DIMENSIONS DO NOT INCLUDE INTERLEAD FLASH. INTERLEAD FLASH SHALL NOT EXCEED 0.254mm (0.010") PER SIDE

F20 TSSOP 1098

**PACKAGE DESCRIPTION**

Dimensions in inches (millimeters) unless otherwise noted.

**Q Package**  
**5-Lead Plastic DD Pak**  
 (LTC DWG # 05-08-1461)

01005 1098

**S8 Package**  
**8-Lead Plastic Small Outline (Narrow 0.150)**  
 (LTC DWG # 05-08-1610)

\* DIMENSION DOES NOT INCLUDE MOLD FLASH. MOLD FLASH SHALL NOT EXCEED 0.006" (0.152mm) PER SIDE

\*\* DIMENSION DOES NOT INCLUDE INTERLEAD FLASH. INTERLEAD FLASH SHALL NOT EXCEED 0.010" (0.254mm) PER SIDE

S08 1298

**PACKAGE DESCRIPTION** Dimensions in inches (millimeters) unless otherwise noted.

**ST Package**  
**3-Lead Plastic SOT-223**  
 (LTC DWG # 05-08-1630)

# TYPICAL APPLICATION

**T Package**  
**5-Lead Plastic TO-220 (Standard)**  
 (LTC DWG # 05-08-1421)
